Right on the money, well said Jeff! This whole NG is a brawl between
disparate cultures. Those of us who do radio because it's radio also
do the dialup/ISDN/DSL or whatever side of personal and hobby
communications, we know what's up on both sides of the coin. But we
might as well be talking to our pet rocks when we try to explain to
the digigeeks that, for one instance, neighborhood VHF/UHF Internet
portals ain't radio in the first place plus we could care less because
we already have Internet access.

2983. PSK31 (and other modes) questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-12 00:00:00 UTC
From: redberd95@aol.comnospam
Message-ID: <20000711234618.10824.00000144@ng-cf1.aol.com>
Source record: 11870

1. Where can I find software for PSK31 and other modes (cw, pactor, rtty, etc) for a 486sx laptop running win 3.1?

2. Can anybody send me a com port interface to be used with a Icom IC706? I have physical limitations that prevent me from building one. I do not have much in my ham radio budget as I am an unemployed graduate student.

Please respond directly to redberd95@aol.com

Don't want to sound negative, Randy, but you may find that your laptop is pretty light for running PSK31 programs. I really don't know which will run on 3.1, but the most likely would be the original program by G3PLX. IF you use some sort of TNC for pactor and rtty, etc., any terminal program will work ok, but since so much DSP processing is done in the CPU and soundcard, it takes a little horsepower and memory to handle PSK31. If your SX is as low as 25 MHz, I seriously doubt that it will handle any of the PSK31 programs, but try it and see!

I am sorry but I have no info to aid you with the 706. I suggest that you post on the icom reflector and the PSK31 reflector for help in that area.

I can empathize with your situation. While I was a grad student at MIT back in the mid-50's I was fortunate to have a Research Assistant position in one of the labs there, but considering the pay I received, it was like being virtually unemployed. Hang in there - even these days shall pass.

If there is a "ham radio" involved in the equation - then it IS ham radio. When you talk thru the local repeater's phone patch - is THAT not ham radio? Of course it is, and so is using radios to "patch" thru the Internet to other radio gateways - the transmission medium is just a little different, that's all. I guess it is just too reliable, and too easy for some of you guys - you just HAVE to do things the hard way, or just don't like change. Pretty stupid, if you ask me.

Source record: 11879

I used to use my old desktop machine on Win 3.1 and the original G3PLX software. Worked fine as long as I used a genuine Soundblaster card. (I had two other cheap imitations that didn't work. Too much distortion.) Then I tried to use my old IBM Thinkpad 350C (486SX-25 and no sound card) with the addition of an outboard sound module. The sound module worked fine but the machine ground to a total halt when it tried to run the PSK software. I don't think you're going to have much luck running PSK on that computer. Sorry.

Yeah right.
That telephone link you use via the repeater is ham radio?
Gimme a break.

Connecting to a local gateway system in the UK, then over the internet,
and then out another gateway system in NZ is ham radio too?
"Gee, I just worked New Zealand on two meters! The band is open!"
Does the ARRL accept that QSL card for DXCC?
No? Imagine my surprise.

The point about the internet gateways is simple: sure they are fun,
sure you and the other ham involved MIGHT be using ham radio
for the uplink and downlink, but what's the point? All either one of
you did was make a local contact on some VHF/UHF band.
Whoop-de-doo, big deal. Nearly zero radio skill involved.
Do the same thing with all links via ham radio and I'll give some
ham (the creators of the gateways) a bit of credit ...

"... the transmission medium is just a little different ..." ???
Yes, it IS different. It is not radio! Duh.

"... don't like change ..." ???
Hams have used the telephone for a really long time, since there was any
ham radio. That is OLD and TIRED technology. Doing the things you
can do with the telephone OVER HAM RADIO is new technology.

Try it! It is fun, and it is radio (see the name of this newsgroup, whichever
one you happen to read this posting in (never end a sentence with a
preposition, so I won't)).

Calculating fresnel zone clearances, so you can determine and build
your towers to produce reliable links is "no radio skill", huh? How
about mounting your radios/computers in survivable NEMA boxes on high
towers to cut down feedline loses? Sorry, but you are suffering
from "radio myopia". You only seem to be able to see below 30Mhz,
(sometimes 54Mhz). I know, let's build a 2m Internet gateway using
sporadic-E and meteor scatter links!

> Do the same thing with all links via ham radio and I'll give some
> ham (the creators of the gateways) a bit of credit ...

You seem to be drifting off to talk about those unreliable HF links;
they are for the birds...

> "... the transmission medium is just a little different ..." ???
> Yes, it IS different. It is not radio! Duh.

So, let me get this straight - the electrical signals passing thru your
radio are OK, but those passing thru the Internet, somehow aren't?

I want to find BASIC programs for ham radio use. I need these in text form, for input into Chipmink Basic for Macintosh. Anyone know any websites that may have some of these? Thanks.

Very eloquently put, and I completely agree. For me, the internet is a
very useful tool, but it holds very little fascination for me in and of
itself. It is an adjunt to other, more important areas of my life.

OK, but what do you want these programs to do?

By the way "Internet" should be capitalized. When not capitalized, it
means something completely different(a local internet - like in a lab,
or in a house).

A very useful tool, huh? If television had such good reviews during
its infancy - where would it be by now. "The" Internet is more than
just a very useful tool. It has only been around for a short while,
but it is already changing the world.

I bet you don't have a cable modem, or DSL hookup yet, huh? That's OK,
you can tap into mine - via RADIO!

I see a cultural element in driving on public roads. Driving on the highways implies a total dependence on society with the subjugation of the individual in the act.

> No one can communicate from point A to point B via
> the internet without tens of thousands of other people showing up to work,
> keeping the multi billion dollar network humming.

No one can drive from point A to point B via the public roads without tens of thousands of other people showing up to work, keeping the multi-billion dollar road system in shape and free from potholes.

The pitiful collectivist parasitic public road driver wimp turns the ignition key which in turn starts the engine which was designed and built by someone else to have the automobile transported over the roads which someone else built. The driver can take about as much pride in completing the journey as he can in forcing the sun to rise in the east each morning.

Driving my home-brew Killdozer, on the other hand, is more an expression of my rugged individualism. Don't laugh. It's got a spacious interior, NO FSCKING SEATBELTS, an extra-large glove box where I keep my well-worn copy of Atlas Shrugged, and other luxury appointments in addition to the armor and weaponry one would expect of a Killdozer. I am in control of the transportation process and need nobody's cooperation whatsoever. Entire societies can and will crumble without impacting my journey.

Chipmunk BASIC used to come with several ham-related samples, but I've noticed that newer versions have omitted most of these (still includes one or two). You might be able to find an older version somewhere on the internet that still has them.

There once was an excellent site like this in Germany. It had about three dozen ham-related programs, nearly all written in Chipmunk BASIC (complete with the text for you to modify). Sadly, the web site designer announced one day that the site was moving, with a notice that the new address would be announced soon. The new address was never announced, and eventually the site disappeared completely.

I wish I could offer you more, but I'm not aware of any site available today that has what you're looking for.

Ralph Mowery <rmowery@dialpoint.net> wrote:

>So what ? Look at all the flaws in the Microsoft stuff. Biggest
>softwear company and even they can not get it all to work all the time
>in every case.

But then it is widely known (and proclaimed by themselves) that Microsoft's
target isn't to write software that works all the time in every case.

Their priority isn't with fixing wellknown problems, but with adding new
features to new versions, in a manner that will leave users of old versions
in the cold with incompatabilities.

So, when your Windows95 with Office package does everything you want except
it has some flaws that you would like to see fixed, what they do instead is
release new software that will write documents that you are not able to
read. So more and more you cannot read docments sent by your correspondents.

When you have shelled out the cash to upgrade, you will find that 30%
of the flaws have been fixed, but there are now many more new flaws.

Even worse: while the old flaws sometimes crashed your system at unexpected
moments, the newfangled flaws are often security problems that allow the
rest of the world to take over your computer and erase all its files.

That is what Microsoft calls "Innovation".

> DONE it??

TAPR hasn't done it because they tried to build their own radio
and failed (I understand Dewayne is going to try and salvage it,
but his company has never built anything before). Many others
(Spread Spectrum is really big out here in the real world) are
deploying networks every day. Almost every University now has
a wireless LAN, and long range point to point links (long range
being 12 kilometres). I have put one up myself to see what all
they hype is about. My home is wireless from the ISDN modem
on, and a 8 km point to point link is working great. This stuff is
as cheap as ethernet was in the beginning days, and I suspect that
10base networks are cost prohibitive (labor plus parts) today.

I see the use of gigabit fiber backbones, and wireless (roam-able)
LANS as the future for medium and large companies. Laptops seem
to be the norm, and not many desk computers can be found anymore
in executive offices. They want to roam. ("Oh give me a home...").

> We had exactly that 15-20 years ago. Almost the entire East Coast was
> blanketed with a readily-accesible ham vhf/uhf digital network and it
> worked like a champ.

Not true. "Worked like a champ" is completely false advertising. It was
a nightmare. The whole system died when it reached saturation.
Hams ran out of money to go to the next level, and nodes started
coming down. They won't be back. Learn to love APRS, because that
is packet radio today.

Wideband analog schemes are obsolete, and the FCC is giving big
hints that Hams need to adopt something more substantial. If all we
are going to do is CW, SSB, and FSK in the microwave bands, then
they have a surprise for us, and it's called an auction.

But the FCC hints with one hand, and fails to enable with the other.
There have been many proposals for rule changes to allow more
technical modulation schemes, but the FCC has blocked them at
every opportunity. Only recently have they begun to change their
tune.

I think the cheap vocoder is going to revolutionize Ham radio. We
will have reason to leave analog methods for completely digital

solutions, using modern (available) modulation methods.

Steve, why do you continually tell untruths?
You were not there, you have no clue what worked or didn't work.

Pay attention to those who WERE there and DID build and operate
such a network. On this particular topic, you are simply clueless.

<rest deleted>

I guess the above is why nobody takes you seriously.
8 km link? ONE link? Between two OF YOUR OWN systems?
That's it?

Maybe I DON'T want you to be the first to link to it. It seems like
you have some underlying pecuniary interest.

But, hey, give me a few weeks. Remember - it is amateur radio - I've
got a job, and I've got to feed the wife, kids, dog, and guinea pig
too. We(at least I) never make a dime off of it - I think that is what
makes this stuff legal in the end.

But he isn't wrong, and I WAS there. What KILLED growth was the
inability of hams to move past the 1200bps standard that worked so well
in the 80's. 1200bps became a ball-and-chain in the 90's. Cheap-ass
hams wouldn't pay top-dollar for plug-and-play solutions, and appliance
operater hams couldn't get cheap 9600bps setups working, and when the
14.4Kbps landline modem arrived - it was all over. We had some luck
out here in Southern California with setting up a 9600bps network, but
28.8/56Kbps landline modems drove a stake in the heart of amateur low
to medium speed(<56Kbps) RF digital communications. This may be a good
thing in the end. All that 1200bps equipment is now obsolete(except
for APRS), and no medium speed standard came to take its place - so we
don't have the "ball-and-chain" effect anymore. We can start off fresh
with a new standard. What is becoming the de-facto standard is
modified part 15 devices on 13cm(forget TAPR's defunct 33cm idea -
PLEASE!). The other MAJOR benefit is that we can now use the always-
connected, high-speed DSL and cable modem hookups to the Internet to
build high-speed gateways.

The top of the bottle is loose - the genie is just about to get out!

> <rest deleted>
>
> I guess the above is why nobody takes you seriously.
> 8 km link? ONE link? Between two OF YOUR OWN systems?
> That's it?

At least he isn't limited to 1200bps!!!!

All it will take is a small critical mass of hams to get things
started, and then we will have a snowball effect like you haven't ever
seen before.

There is STILL time to get in on the ground floor. Don't be such a
naysayer, and start working with us.

Hi, Stewart!

I understand your cheering alternative and more innovative forms of amateur radio. But saying the HF enthusiasts' interests are stupid?

Any commercial fisherman knows the advantages of a deep water boat, huge nets, radar, and so on. Yet many folks still enjoy standing in cold water with little but a rod, reel, and hand-tied lure to (maybe) catch a trout. Are they stupid?

Of course not - there's fun in the challenge, the silence, and the contest between one individual and an unseen fish. Some feel the same way about eaking a distant little signal out of the noise from another ham station who-knows-where.

'Tis a big tent, this hobby is. There are too many others who covet the whole tent (little LEOs, various government/military/broadcast/etc. interests, and on and on). Let's *cheer on* ALL of the members of this delightful persuit!

Jim Horn, WB9SYN/6 (on the 'net since '82)

I should point out that I could go farther, but that I don't know anyone
who is willing to link. I think the maximum range at my antenna altitude
is 12 km.

1.6 Mbps at 500 mW. What do you have that makes this "WORSE?"
Are you doing higher bandwidth at longer range for less money? Show
me the references, I am not worthy...

> Fiber? This is ham radio?

Yep. Do you use wire between your radio and computer? fiber?
Do you use commercial power?

> I guess the above is why nobody takes you seriously.
> 8 km link? ONE link? Between two OF YOUR OWN systems?
> That's it?

Nope. One system is mine, the other is a friend. You assume too
much Grandpa.

have fun,
Steve/k5okc

I understand you have some low baud rate commercial TNC's??

Did you get rid of them and homebrew your own now Grandpa??

Do you use wires to hook up to the computer, or is it Ham radio
all the way to the keyboard, mouse, and monitor? USB hubs and
Serial ports aren't Ham radio either you know...

Sorry, I was. I joined packet in 1989 when it saturated out. In 1990 it started its plummet to extinction. I stopped using the BBS when we couldn't get any messages forwarded from the war zone. We finally went to MARS for voice and RTTY relay circuits. Thank God for Non-Hams!

> > > On this particular topic, you are simply clueless.

Nope Grandpa, your brain is as shrivelled-up as your dick.

> No N0MHS in any of my old logs.

Oh boy, I'm rolling on the floor... stop! stop! my sides are hurting...

Only REAL Hams are in his logs, but he only tells you who isn't in them, not who is. I know for a fact that his callsign and 15 SSID's are the only thing in there... (he has a bunch of nodes that go around in circles).

I AM the reference. There are those that lead, and those that follow.
I lead - Webster follows.

Part 15, my friend. You don't think I would advocate improving the
range of $100 part 15 network cards by hooking up inexpensive external
high-gain directional antennas, placed up high, with low-loss coax
feedline, creating fairly long-range and virtually un-interceptable

links, and causing little noise to other devices - even though it would be EASY for most anyone to do. That must be left to us amateurs, who would be responsible that little or no "commercial" traffic passed over the link. Although we will somehow allow the buying and selling of ham gear - right???!!!! ... or the use of phone patches, where the Cell Phone network is now available???!!!! Please, my friend, it is time for us to move forward - and there is already precedent.

The genie wants out of the bottle.

Oh, by the way, the Internet has legs too.

As you said above "... you can tap into mine - via RADIO!"
So I will do exactly that.
To make it even more clear: I take you up on your offer.

Now tell me how to do it.
Or are you just blowing smoke?

Not at all - Tuesday the "cable guy" will show up at my house to hook
up the cable modem. The following week I'll take and pass me Extra exam

(incidental). Then I'll start hooking up a couple of Proxim RF LAN cards on a few machines, and setting up a Linux gateway box. I've got a lead on some used Rohn 25G tower sections for about $40 a pop. Before the tower is up(56ft?), I've got to design a NEMA box inclosure to mount the gateway computer near the top of the tower(lots of feedline loss at 2.4Ghz), in a survivable package(I don't want to be climbing that thing any more than I have to). When it's done, you can be the first to link your RF LAN PC thru my gateway - but if it is done according to ARS rules, we need to keep the commercial content down (keeping with the "spirit" of the law, I have no pecuniary interest, you know).

The amateur programmers often don't know
how to set the parameters for compiling.

You have to use the same font size then,
which was used during compile.

a most common shareware software bullshit problem.

Never pay in advance.

3026. EASY MONEY-NOT A SCAM!

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-14 00:00:00 UTC
From: nlbellot@bellsouth.NET
Message-ID: <396E8243.7FAF182C@bellsouth.net>
Source record: 11814

EASY MONEY - NOT A SCAM! I found this on a bulletin board and decided to try it.
A little while back, I was browsing through newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! So I thought, "Yeah right, this must be a scam." But like most of us, I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured, "What have I got to lose except 6 stamps and $6.00, right?" Then I invested the measly $6.00. Well GUESS WHAT!?... within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end of the second week I had made a total of over $1,000.00! In the third week I had over $10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!! Let me tell you how this works and most importantly, WHY it works... Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy! Suggestion: Read this entire message carefully! (Print it out or download it.) Follow the simple directions and watch the money come in! It's easy. It's

legal. And, your investment is only $6.00 (plus postage) IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is 99% no risk - it really works! If all of the following instructions are adhered to, you will receive extraordinary dividends. PLEASE NOTE: Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list. Here are the 4 easy steps to success. STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your : name and address, and a $1.00 bill. What you are doing requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office : (1-800-725-2161) and they confirmed that it is indeed legal. Mail the 6 envelopes to the following addresses: #1) Joe O&#65533;Gorman 432 Farm rd., Arlington, VT 05250 #2) Floyd Scott 145 E. David Dr., Nashville, IL 62263 #3) S. Asfaha 1700 Four Oaks Rd. #217 Eagan, MN 55121 #4) Ian Robertson P.O. Box 163 Monterey, VA 24465 #5) Ashley Blankenship P.O. Box 153 Monterey, VA 24465 #6) Niki L. Bellot, 65780 J. R. Drive, Plaquemine, LA 70764 STEP 2: Now take the #1 name off the list that you see

above, move the other names up (6 becomes 5, 5 becomes 4, etc.) and add YOUR Name as number 6 on the list. STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups) All you need is 200, but remember, the more you post, the more money you make! You won't get very much unless you post like crazy. :) This is perfectly legal! If you have any doubts, refer to Title 18 Sec.1302 & 1341 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of integrity, the program will continue and the money that so many others have received will come your way. NOTE You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.) So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you're in business! DIRECTIONS FOR HOW TO POST TO NEWSGROUPS Step 1: You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory. Step 2: Open a blank 'notepad' file and place your cursor at the top of the

blank page. From the 'edit' menu select 'paste'.
This will paste a copy of the letter into
notepad so that you can add your name to the list.
Step 3: Save your new notepad file as a
.txt file. If you want to do your postings in
different settings, you'll always have this
file to go back to. Step 4: Use Netscape or
Internet explorer and try searching for
various newsgroups (on-line forums, message
boards, chat sites, discussions.) Step 5
Visit these message boards and post this article
as a new message by highlighting the text
of this letter and selecting paste from the edit
menu. Fill in the Subject, this will be the
header that everyone sees as they scroll through
the list of postings in a particular group,
click the post message button. You're done with
your first one! Congratulations...THAT'S
IT! All you have to do is jump to different
newsgroups and post away, after you get the
hang of it, it will take about 30 seconds for
each newsgroup! **REMEMBER, THE MORE
NEWSGROUPS YOU POST IN,
THE MORE MONEY YOU WILL MAKE! BUT YOU HAVE
TO POST A
MINIMUM OF 200** That's it! You will begin
receiving money from around the world
within days! You may eventually want to
rent a P.O.Box due to the large amount of mail
you will receive. If you wish to stay
anonymous, you can invent a name to use, as long as
the : postman will deliver it. **JUST MAKE
SURE ALL THE ADDRESSES ARE
CORRECT.** Now, each of the 5 persons who
just sent me $1.00 make the
MINIMUM 200 postings, each with my name at
#5 and only 5 persons respond to each
of the original 5, that is another $25.00
for me, now those 25 each make 200
MINIMUM posts with my name at #4 and only 5
replies each, I will bring in an
additional $125.00! Now, those 125 persons
turn around and post the MINIMUM 200
with my name at #3 and only receive 5
replies each, I will make an additional $625.00!
OK, now here is the fun part, each of those
625 persons post a MINIMUM 200 letters
with my name at #2 and they each only
receive 5 replies, that just made me $3,125.00!!!

Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625,00! With an original investment of only $6.00! AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is do you realize that thousands of people all over the world are joining the Internet and reading these articles everyday? JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will really work!!!

Like I said, you were not there.
We're talking 1983-1985 Steve, when things got going.
When you, and others like you, arrived in 1989-1990, everything started
going downhill fast. Perhaps there is a clue lurking in this observation.

The logs were published. If you were around, you would know this.
If you were around and had an interest in the network, you would
probably have a copy of those logs. Many people did. You probably
don't even know what I'm talking about ... although you would if
you had studied the network enough to learn it's history, a topic about
which you keep claiming expertise. I probably should mention that
SSIDs are not in the logs, for the obvious reason. But you knew that,
didn't you?

Please share this with fellow computer wizards and witches everywhere . . .

The links are ready, the slammers are ready, it is time . . .

The 2000 west coast poetry slam Championships in Big Sur, Cali are waiting for you. You can listen to all of the performance poetry action as it happens from the Spokenworld.com website, http://www.spokenworld.com.

$2000 is up for grabs in the 2 day event and the fight is sure to be your favorite as defending co-champions San Francisco roll into toen and take on a gaggle of teams from up and down the west coast.

This is performance poetry at it's pre-national best Friday from 11a-6p and Saturday from 11a-6p Pacific Time.

You will need realplayer to listen to this event. Time and availability subject to change, check the site for additional details.
Sponsors for this years West Coast Championship Poetry Slam are Monterey based Therapeutic Massage provider Imani Healing Arts, Santa Cruz based public radio station, KUSP 88.9 FM - www.kusp.org, Monterey Mattress Company, and local internet radio station www.radiofreemonterey.org.

Scaling down to NBFM bandwidths, this would be 1-2 mW levels at NBFM
bandwidths, so we are talking about line of sight paths, right ?

I think what you're trying to say, is that there is some value of purity in transporting data via Ham radio only.

This purity seems to be the cornerstone of your presence here in the newsgroup.

Since there is no off the shelf spread spectrum from any Ham dealer, Hams therefore, must design their own, or use an wideband analog method to get the same data rate.

I don't think there is much value in purity for purities sake. That's the simple difference.

You're not going to convince me that a low data rate Ham product is going to satisfy me, when I'm using a high data rate product, and purity wasn't one of my goals.

Purity arguments to me, fall into the same can where I throw Morse code testing used to filter out people who would enjoy radio otherwise.

I can not be converted to a "purity uber alles" motivation, so I don't understand why you keep trying. There is no argument for purity that doesn't sound a little like the "Jewish Solution." About the only way you are going to succeed, is if you start building ovens.

Wow - so much anger and bad will between people here. To quote the great Rodney King ï¿½Why canï¿½t we all just get alongï¿½?

ï¿½Forget HF & CW - Think Digitalï¿½

As I see it, this is not a discussion about communication technology past and future. The underlying debate is the chasm which is growing between two factions of people, the Ham Radio Operators and the Internet Users. I guess I should give a partial definition of what I think these two groups are.

The Ham Radio Operator - is interested in the art and practice of communicating over a radio. Often, the content of what is transported is of secondary importance to the fact that he/she is skillfully operating a radio.

The Internet User - is interested in transporting his/her thoughts and creations (AKA Data) from point A to point B via the fastest most reliable means. The primary focus of their passion is the ï¿½Dataï¿½ itself. The medium by which it gets from point A to Point B is irrelevant.

So what we have are apples and oranges. The digital technology tsunami is here today and will not stop growing. This is great news for the Internet user who is interested in pushing his Data somewhere. It is also great news for the Ham Radio operator who will reap benefits yet undefined. Advances in digital technology will find their way into the radios and accessories used by Hams.

So technology is not a threat and yet people are up in arms. Hereï¿½s my guess as to why.

Most Ham Radio Operators do not find any conflict trying to decide whether they are either an Internet User or a Ham Radio Operator because they understand that they can be both. They also understand that both are entirely separate states of being. If there were a news group such as ï¿½rec.internet.surfingï¿½ (I donï¿½t know if there is and I donï¿½t care), I doubt you would find any Ham Radio Operators flaming away about Ham radio operating being the same as Internet surfing. A large factor in this is the fact that there are no constraints to getting onto the Internet. The Internet does not require any demonstrated skill on the part of the user and it is immune to the adverse affects from unskilled users. It is idiot proof and therefore can be offered to idiots.

The Internet User who chooses to acquire the legal paperwork to call himself a Ham Radio Operator (easier now than at any time) is destined for conflict. He views the radio as a small sub-component in the network required to transport his Data. Remember that the transport medium is irrelevant to the Internet User. The idea that he should be required to jump through any hoops just to attach this radio component to his digital system is annoying. He finds himself surrounded by a group of walking, talking dinosaur fossils (people who identify

themselves as Hams) that seem to have some silly attachment to this one piece of hardware (the radio). How silly, when it is common knowledge that hardware becomes obsolete in a matter of months. And still this Internet User has gone the extra mile, jumped through the hoops and has acquired the legal paperwork to call himself a Ham, and damn it! That makes him a Ham too! Still the dinosaurs are not accepting him as an equal!

The rub arises because the Internet User sees Radio in a supporting role to his Digital interests. Ham Radio Operator sees computers and digital communications in a supporting role to his Radio interests. The fact that hams are using the Internet to read and post messages to this news group means that they have had some exposure to the ï¿½Internet Usersï¿½ experience. It is possible that many Internet Users who acquire Ham licenses have never had a ï¿½Ham Radioï¿½ experience and therefore do not understand what the fuss is about.

Ham Radio Operators do not ï¿½Useï¿½ a radio, they ï¿½Operateï¿½ it. The operation of the radio is an art form that takes skill, practice and perseverance. The diversity of Ham operating activities is much wider than counting the number of modes available to him. Often, the most fulfilling activities utilize the oldest modes of communication. It is the pursuit of the ï¿½artï¿½ of radio operating that attracts and keeps Hams. All Hams know that technology does not ï¿½makeï¿½ the operator. In competitions, there is no doubt that a skilled Ham at the controls of an obsolete second-rate radio can beat the pants off an unskilled operator armed with the latest radio gizmo.

An analogy may be made between Radio Operating and Sailing. The use of sailboats today may be called a sad attachment to an obsolete technology when it comes to transporting goods and people from one shore to another. Still sailing has its following. The sailor may employ some of the goodies of modern technology (GPS navigation and composite construction materials) yet the basic nature of sailing remains the same. It takes skill, practice and perseverance to master the art of piloting a sailing craft. The transportation goods and people from one shore to another is no longer the main objective of sailing. The sailor wants to experience the motion of the sea, the wind in the rigging and the challenge they can bring him. Itï¿½s an art form in a day and age were art is no longer appreciated.

Lets consider the Ham operator to be likened to the sailor. It is the journey which is the end to it self. It is the practice of the art of operating. There can even be an element of person-to-person competition as in a yacht race. In this analogy, I would liken the Internet User to the owner of a Japanese automobile. The car originated on a distant shore and was transported over the seas in a very large impressive ship to be delivered to the Internet User. The Internet User proclaims himself to be a sailor and asserts that it is foolish for sailors to hang onto the past when the bright future is found moving about in Japanese cars. Strange how the sailors arenï¿½t warming up to this new chap.

If you can hold your breath long enough, all this fuss will evaporate. The commercial sector is working as fast as it can to offer Internet Users a cornucopia of wireless digital communications options and will make them as painless as possible. Wireless high-speed Internet access is just a heartbeat away. When this becomes available, the Internet User will have no cause to

stick with the perplexing community of Ham Radio Operators. He can proclaim that Ham Radio has failed him and that it is doomed to oblivion. Ham Radio Operators will no longer be challenged to accept the Internet User into the Ham community.

In the longer picture, all the resources allocated to Hams in the VHF/UHF/SHF regions will be lost to the commercial sector. Money will win the war for these limited resources and the Internet User will be burning up the radio waves long after the Ham has been evicted.

But somewhere on the stormy seas (solar flare hitting the ionosphere) there will still be sailboats (HF radios) being piloted by skilled sailors (Ham Operators). Only they will know what they truly have.

PTT is more reliable than VOX on many rigs. VOX also opens up the potential for windows sounds to get transmitted. PTT via the serial port does work. If you're using the diode method to key from both the RTS and DTR signals, try connecting only the line you actually use with your software.

One way to test your PTT circuit is with a 9-volt transistor radio battery. Disconnect the computer and connect the battery between the common and signal lines goint to the PTT circuit. One polarity should key the rig and the other should not.

HA!

In the 1980's 1200bps packet did grow fast; but what KILLED growth was the inability of hams to move past the 1200bps standard that worked so well in the 80's. 1200bps became a ball-and-chain in the 90's. Cheap-ass hams wouldn't pay top-dollar for plug-and-play solutions, and appliance operater hams couldn't get cheap 9600bps setups working, and when the 14.4Kbps landline modem arrived - it was all over. We had some luck out here in Southern California with setting up a 9600bps network, but 28.8/56Kbps landline modems drove a stake in the heart of amateur low to medium speed(<56Kbps) RF digital communications. This may be a good thing in the end. All that 1200bps equipment is now obsolete(except for APRS), and no medium speed standard came to take its place - so we don't have the "ball-and-chain" effect anymore. We can start off fresh with a new standard. What is becoming the de-facto standard is modified part 15 devices on 13cm(forget TAPR's defunct 33cm idea - PLEASE!). The other MAJOR benefit is that we can now use the always- connected, high-speed DSL and cable modem hookups to the

Internet to build high-speed gateways.

The top of the bottle is loose - the genie is just about to get out!

Actually, most of the anecdotes about human ability to copy CW signals "10 dB below the noise" are referring to the ability to copy a slow OOK CW 10 dB below the noise *in a 2000 or perhaps 500 Hz bandwidth." If the necessary BW of a slow OOK CW signal is 50 Hz, I don't think that that many (or any?) of these operators could copy a signal that is 10 dB below the noise in the necessary bandwidth of 50 Hz. Yet some of the digital systems can manage that, no?

Right. In my case, when I listen to a weak CW signal, I don't see
much difference between the 2K filter and the 500 Hz filter in the
absense of interference. But then, I am not one of those "skilled
operators." I think the human ear and brain probably has the ability
to do a certain amount of band pass filtering.

In any case, for an optimal implementation, OOK is worse the PSK but
not all that much.

Well, you could be right, but let me throw in what I think is going on:

My Ham radio activity has nothing to do with my data link activity

When I get on Ham radio I generally do it for relaxation. When I solder stuff
together on the kitchen table, Tubby (the Cat) keeps me company and we
read schematics and play with the breadboard parts.

PSK31 and CW are relaxing and fun, SSB on 10 meters is fun. When I'm
done, or have had enough, I shut the radio off, and go do something else.

On the other hand, the Ham who spends 24 hours a day on Ham Radio
data links, is completely frustrated by someone who gets more out of
a Part-15 device that is also cheaper than his 300 baud HF link modem.
This frustration points only toward the data link part of someone's hobby
(calling them non-Hams and telephone hams, etc), rather than even
noticing any other aspect of what Hams do for relaxation.

Except possibly for those of us who have data links, but also are active
on CW, SSB, PSK31, and other modes on various bands. Nobody
makes it impossible for me to operate, for example, CW. The Land Line
Lids *do* make it impossible for me to use my data links. If there was
someone who followed you around every frequency you operated, and
always answered every one of your CQs, and in every way they could
QRMed your PSK31, CW and SSB operation, you might tend to get
a bit miffed at them. What appears hard for hams who do not operate
data links to understand is just how prevalent and persistent is the
interference from these folks. It is always there, and it is total.

Thus the term "Land Line Lids". They force the data to go over the
internet BEFORE it is possible to move it via radio.

So I spend very little of my time on the digital modes anymore, since
there is no point in that. More time for other modes ...

But it is sure fun to troll for them here ... they are always ready to
denigrate
what has been accomplished using ham radio digital modes.

From: sdeyoreo@my-deja.com
Message-ID: <8kog7bcfg1@nnrp1.deja.com>
Source record: 11835

I'm looking for a program that can do IF filtering at 12 Khz. I can do the math for the filter, but I need a program I can use or edit that can fill a buffer full of soundcard samples, and also output a buffer full of samples to the loudspeakers. Any help? Ultimaly, I'ld like to do a PC radio with all IF and AF done in the computer with a DDS for local osc.

3048. Help - Naval Academy ham radio club in danger!

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-15 00:00:00 UTC
From: k3for@aol.com
Message-ID: <20000714223022.20048.00000250@ng-fj1.aol.com>
Source record: 11836

Help!

I am looking for other Naval Academy graduates or US Naval personnel who can assist me in saving the amateur radio club at USNA.

I have been the officer rep for the past 2.5 years, but a decision was just made in the past 48 hours (over the summer while the mids are conveniently out at summer training or on leave) without notice or discussion, to disestablish the station W3ADO (also Navy MARS station NNN0NNN). Perceived lack of participation, lack of knowledge of our various missions and accomplishments ("oh, ham radio is dead..."), and funding probably played a role.

Mailing address for support letters:
Captain Sam Locklear, USN
Commandant of Midshipmen
101 Buchanan Road
US Naval Academy
Annapolis, MD 21402

cc me at:
Ryan "Skip" Johnson
510 Norton Lane
Arnold, MD 21012
k3for@aol.com
if you can

Or if you can't write a letter, please email me something and I will forward it to the Deputy Commandant by email.

Thank you ! I only hope its not too late -- I have to run down there and see if they've thrown out the gear already...

NEW: Pay 50% now, 50% after filing! You won't get THESE arrangements anywhere else!

We'll NEVER throw you that tired old line which states: "Payment in full must be received BEFORE services will be performed..."!

We are now accepting applicants for the second LPFM filing window. We will only accept a limited number of applicants for the second LPFM filing window. To be one of the clients for the second filing window (Connecticut, Illinois, Kansas, Michigan, Minnesota, Mississippi, Nevada, New Hampshire, Puerto Rico, Virginia, Wyoming), go to our credit card acceptance page or contact us by whatever method you prefer from our contact page.

Some lessons soon to be learned by LPFM applicants: At LEAST four of the applications which will be returned as "flawed" are from applicants who assured me, personally, that they "can file this application without having to pay for any technical help"... Looks like they fell into an NAB sponsored(?) "dis-information" trap...

What you are looking for is not "a program", but the API (application
program interface) to the sound system in your computer.

It is made available by the operating system, when that supports sound.
Documentation is usually found at the site of the company or group
supporting your operating system.

Source record: 11840

It's probably best to make a chart that shows the number of
messages handled, by the number of radio operators using the
facility. The number of hours the equipment had an operator
present, by month.

The way these things usually work, is that someone really
wants the room you're in. Look at the adjoining rooms and see
if they are so big with activity that they want to expand into
your room. Maybe the solution is to find another room.

This is a test to see how far you can bend over backwards.

Can't get a cable modem or DSL connection, eh?

Don't worry, we will be able to help y'all out quite soon.

BTW, the "cable guy" shows up Monday, and my Rohn HBX48 arrives Friday -
I already started digging the hole.

I'm researching buying a mid-range Digital Camera to track my progress -
I think I'm gonna get a Fuji MX-600.

Klein:

Excellent analysis. No bias or emotion, just plain objective statements and musings. I like it.

Other than my own feeble attempts to get folks to look at and understand the merits of CW, your comments here on this thread are a very thoughtful examination of the phenomena of which I wrote.

The situation of human operators beating out all forms of modern digital communications using CW on real HF channels are real and not just idle claims.

I believe that there is some justification in asking why, and trying to find out why and how this happens.

I know there are sceptics. But this scepticism comes only because there are [relatively] few really skillful except nois and interference on frequency while two skillful CW operators were continuously passing 100% perfect copy traffic on that frequency! One cannot expect them to know about the existence of such capability when they are not skilled enough to observe and hear what's going on.

Sort of like trying to explain the benefits of calculus to a grade 4 student, they just don't get it!

That does'nt mean it is not true!

There is something going on there in the human brain processing [Psycho-acoustical phenomena and brain post processing, a full Baysian receiver?] and other aspects of the CW system that could and should be investigated for sources of new robust methods of digital signalling at even higher speeds.

And... what other area by professional communications engineers?

Modern digital systems could be improved by emulating any such algorithmic knowledge gained from a study of skillfull high speed CW operators operating in a typical HF channel with noise and interference.

More, thoughts, comments,

Steve and Klein:

I respect your rights to your opinions and to your own classification or phylogenic systems, but the "convention" has always been to at least conceptually separate "channel coding" from "modulation".

Of course the ones who ignored this conceptual dictum [Gordon R. Lang in Canada and Gottfried Ungerboeck in Switzerland] were the ones who invented coded modulation! With coded modulation it is often impossible to separate the channel coder from the modulator since they are intrinsicaly bound up together. Neat idea! Thanks Gord and Gottfried! Gordon invented "lattice coded modulation" in the late 1970's [1976 - 1978] at Motorola in Canada and designed and built a Leech Lattice modem. The first coded modulation system. The Leech Lattice is a "natural" lattice or polytope in 24-dimensional space which has a sphere packing density very close to the maximum possilble. John Leech, now deceased was a Canadian mathematician employed at University of Waterloo. Later in a paper published in 1982 and in patents granted later Gottfried Ungerboeck who was then working for IBM at its' Zurich Switzeland laboratory invented "trellis coded modulation" in which a covolutional channel coder was married to a phase shift modulator. Late Gottfreid's trellis coded modulation was generalized by many others and is now the most widely used coded modulation system [Or probably the most widely used modulation system period!] in use. All modern telephone modems such as the ones we are using as we type here on the NG use trellis coded modulation. V.32, V.34, and V.90 modems all use trellis coded modulation!

Back to CW and its' amazingly efficient but simple to implement capabilities.

I believe that in the conventional sense CW as a channel coding system is "ternary". It has three and only three symbols, the dot, the space, and the dash. Call them A, B and C if you wish. This is independent of time and unit intervals etc... it is strictly "channel coding".

Then the classical modulation method for CW is straight forward on-off-keying [OOK] of a "continuous" carrier. Of course the ternary coded channel coder output could be used to "key" many different modulators, like PSK, or FSK, or QAM, or whatever...

So I say CW channel coding is ternary, not binary.

Ed:

What you are discussing here is approximate "matched filtering".

Matched filtering sounds exotic, but its' really simple! [In theory a perfect matched filter is impossible to achieve since it requires that the filter be anti-causal, that is the output comes out before the input arrives. A good time domain description of the impulse response of an ideal matched filter is that its' impulse response must emulate or produce the time reversed image of the desired signal!] In practice what digital receiver designers do is to approximate the ideal matched filter in some sense. This approximation is usually done in the frequency domain. When a matched filter is approximated in the frequency domain it of course will have a causal impulse response and does not respond before its' inputs arrive, and to that extent it deviates from and is only an approximation to a matched filter. Now if you look at the frequency response of the matched filter and "eyeballed" it and also "eyeballed" the frequecy response of the desired signal you will immediately see thaty their frequency responses are approximately the same! Simple idea but arrived at by abstract mathematical reasoning. This is just the sort of filter any unsophisticate ham would have used! Look at the transmitted signal, and then use a receive filter approximately the same shape! What? Simple, eh.

Now one needs to ask how close to the ideal unrealizable matched filter do actual implemented matched filters become and how would you measure the deviation? Measure it how you wish in terms of mean squared error or deviations in dB of the frequency response averaged over frequency bands of interest or whatever...

You will find that good transceiver CW filters are often much more closely "matched" to CW signals than most modern digital system matched filters are... essentially those modern digital matched filter designers "skimp" on their designs. And so if you operate CW and use your transceiver's CW filters, don't worry... for all practical purposes you are using matched filtering! Period, end of story.

When you can't hear a CW signal in a 2 kHz band and you cut in your transceiver's 250 Hz or 100 Hz CW filter and it magically pops up out of the noise...

Well that's "matched filtering".

CW can use matched filtering just as any modern digital system can, and what's more...

Most CW filters in modern ham transceivers are better matched filters than the so called "matched filters" in digital systems. i.e. the matching is

closer!

Ed, I hope this helps, and it helps some of the undereducated digital bigots
to appreciate matched filtering a bit more.

Laura:

Young lady, making a simple spark gap and a crystal radio receiver to send and transmit CW signals only needs a few items that one can pick up from the local hardware store or garbage dump. Wire, a toilet roll or two a homemade capacitor, from wax paper and tin, a battery for the transmitter, a spark plug or, a piece of galena crystal or a simple discarded razor blade, etc...

It needs no transistors least of all chips holding 5 - 10 million transistors!

Now I don't advocate doing that as a general means of operating communications systems [Myself, I run stuff like FT-1000's with PTC digital modems, etc...], but the actual ingredients needed for simple but powerful digital communications are indeed simple.

One might ask how much the addition of 10 million transistors has really bought us?

Thank you for your thoughtful responses Peter.

Your description of matched filtering is quite correct. Sometimes it is more useful to think of it backwards from the way you have described it. I.e., first you design a good receiver filter. Then measure its impulse response. Then generate a transmit filter that has the time reversed impulse response of the receiver filter. This is especially useful when dealing with digital modulation because many times the transmit filter can be realized in a ROM that can be addressed by relatively few bits.

An interesting case in point is the IS-95 CDMA cellular system. Here, the modulation is QPSK at the pseudo-noise chip level. The receiver matched filter is mechanized at IF using a surface acoustic wave filter with essentially flat top and very steep skirts, but yet quite realizeable, repeatable and cheap. We characterized the impulse response of this filter and generated the time reverse of this in the transmitter using an oversampled read only memory. I.e., the filter's response at many samples per baud are precomputed and stored in a memory. The memory is addressed by a shift register containing a number of sequential bits and by a counter that indicates whether you are on the 1st, 2nd, or .... the Nth sample of that chip. The ROM outputs an 8 bit (e.g.) word and this is converted to analog in a DAC.

Oh, I should mention that the rest of the matched filter in the spread spectrum receiver is simply an accumulator that adds up all the sampled SAW filter outputs that occur during the time of one data symbol.

Sometimes bassackwards thinking works pretty well.

As for whether CW is binary or ternary (or whateverary), I'll just say that it is what it is and what we call it is only useful in how it helps us design better systems. For my way of thinking about it, I find that the binary definition leads me to an optimum receiver a little quicker. Maybe ternary works better for you.

The DSP-599zx upgrade is ready - we will take orders immediately and begin to ship within a week from July 17.

The DSP-599zx's new features include:
Binaural CW, the CW Spotlight, a modified Noise Reduction algorithm, and a new Filter/PC-Radio interface mode for PSK-31.

See our website for details - http://www.timewave.com

That assumes that you consider a spark gap and a crystal radio "modern digital communications" - I don't. I enjoy CW but most of the time it's not the most efficient means to transfer data. How long do you think it would take to send a 1 MB binary file at 20 WPM CW and what are the odds of it being received "error free"?

Bob:

Heh, heh...

How much "real" information is in that 1 MB file?

Sorry...

My point really wasn't about that issue. My point was about "efficiency"
and its' "simplicity".

Boy scout, survival mode kind of issues, minimalist requirements for
communications, etc...

Most modern up to date technologists wouldn't know how to put together a
workable communications system on a life raft, mountain pass, desert island,
or whatever... without 10 million transistors and 100 MB of code... A
really knowledgeable person who understands how things work at a basic lever
could do that with a few pieces of readily available junk. Lifeboat hand
cranked radios...

So what's your point?

Let me start slow, man. But anyway, the fall from 50 feet will almost
kill me just as good as that from 200 feet:) Besides, I'm going to
have enough trouble getting a permit for a 48ft. tower.

Where do you get those linesman's belts that you attach yourself with
while your working on the tower?

Did you stock up on "essentials" before Y2K? I bet you've got a few extra cans of tuna fish in your cabinets! Look - going around all "scart" of modern technology is NO WAY TO LIVE.

Besides, you are being silly - even at your so-called "basic lever (sic)" you are STILL hamstrung by technology, and dependent on technologies(albiet old ones) to provide you with the materials.

Your problem is that you just don't like(or are afraid of) change, pure and simple. As technology is changing faster and faster, you guys look sillier and sillier.

To be honest, I'm 41 and a Software Engineer(we've risen from the depths of being called "Computer Programmers", and sport among our ranks the wealthiest human beings), and I know how you feel, All this change is enough to drive you batty. Integrating complex systems gets more and more difficult each year. Sometimes I wish things would slow down a little so that we could document the system procedures, detailed drawings and parts lists, etc. (actually we are doing this more). The problem is - if a company spends too much time "firming up there position", I young, hotshot competitor will come along and cobble together a BETTER system, using MORE MODERN technology, and PUT YOU OUT OF BUSINESS. We are seeing evolution in action first-hand.

>

Every byte is "real" information, Peter. If you get one byte wrong the program may not run at all.

> My point was about "efficiency" and its' "simplicity".
>

I guess I missed your point. The previous poster commented on how we depend on the work of others (example: ICs) to build a modern digital communications system and I thought you responded by telling her that you can do it with a spark transmitter and a crystal detector. I say that's not "modern digital communications" but I agree that it is "simplicity" and it doesn't depend upon any man-made infrastructure.

Its "efficiency" depends entirely upon what kind and how much data you want to transfer. As I said, it's not very "efficient" if you need to transfer a 1 MB exe file. If what you need to do is transmit an "SOS" from a lifeboat then it'll suit you quite well (assuming there's still someone on the other end who can receive your SOS :-)). If you enjoy chatting with another person using Morse then it'll also suit you quite well. No need to pretend that CW is modern digital communications - CW can stand quite well on its own for its simplicity and personal enjoyment.

3073. Re: Timewave ready to ship DSP-599zx firmware upgrade!

Peter,
Thank you for your inquiry.

This particular upgrade is for the DSP-599zx only, because the DSP-59Y does not have the external connections necessary for some of the new features. We have not ruled out the possibility of some sort of partial upgrade for the DSP-59Y at a future date.

I doubt that anyone could put together a CW rig on a life
raft/mountain pass/desert island , unless they were well stocked. Then
they would need an HF antenna and would have to find someone who knew
the code. If you're going to have to carry in radio parts, a soldering
iron, power mains and a code operator, wouldn't it be easier (and
safer) just to buy a million transistor satellite radio...

Actually, when I went to USAF water survival school, the best
devices were the signal mirror and strobe light.

Sweep the horizon with the mirror. Use your strobe at night.

The radio is in a plane at 35k, or a ship on the horizon...

For most aircrew, the first thing that sinks to the bottom, is the
survival radio, after the first 100 ft wave crashes over your raft.
Water, food, puke, etc, it's all lost in the first 10 minutes...

Pray tell - how does one generate CW using only a spark gap transmitter?
The last time I looked, they generated damped waves - certainly NOT CW.
Throw an alternator in there, and you may have a point.

Wasn't this covered on the Novice exam?

3082. Argh! Need help calibrating MFJ TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-16 00:00:00 UTC
From: ken.hoover@yale.edu
Message-ID: <sn48m1a1nd663@corp.supernews.com>
Source record: 11770

This is driving me nuts. I have a MFJ 1276 TNC (basically a 1270C with PACTOR capability - it uses the same manual) that I'm trying to use for plain old 1200 baud 2 meter packet. When I got it a while back (from ebay) it would receive fine but I couldn't connect to everything. Figuring that it was probably in need of calibration, I started in on the process listed in the book.

Without elaborating too much on the details, I was able to get the HF and VHF modulators aligned fine (using the software-based calibration procedure since I don't have an oscilloscope) but the demodulators just are not behaving the way that the book says they should even though I'm following the process exactly.

If anyone has done this type of calibration on one of these monsters, PLEASE email me directly. (And no, my ham budget won't accomodate replacing the TNC so please don't suggest that.)

Thanks in advance for any help you can give!

One can use lots of sparks ...

Simple spring and magnet device will do the trick to make the sparks,
couple to any old tuned circuit. e.g. doorbell plus wax paper roll inductor,
plus tin foil and wax paper capacitor. Works. Done it.

The problem is the wire. When lost in the mountains, you first have to
locate some appropriate ore, smelt it, draw the wire. Big project. Good
to have iron or nickel, since you might want to make that magnet ...
... after you made some tools to handle the wire drawing ...

Probably simpler to locate a garage sale. You can find everything
you need at most any garage sale.

I thought so too, Rich, but I was corrected. The later spark gap transmitters
used a sustained arc and were perfectly capable of CW.

Yes, I'm sure that must be correct...

> Retort 2: Gee, even I keep my cell phone locked to my belt. Do you
> think I should write the Air Force with this idea...

Yes, write them. They'll be sure to consider it, I'm really sure...

Generally speaking, the aircrew ends up in a chute with their
seat-kit dangling below their butt, with a tug on the line the
raft inflates and the survival kit hangs down below that. As soon
as you hit the water the wind starts dragging you along at about
30 knots and your survival kit explodes into the first wave, with
little things tied on with small parachute cord. After the first bounce,
everything weighing over 1 pound is lost. That leaves you with a solar
still, a mirror, and a strobe light :-) After sucking in a gallon of sea
water you vomit everything from the colon up, and then have the dry
heaves for an hour.

OK, OK, I'm exaggerating...

Anyway, you don't feel like breaking out a straight or iambic key
and sending out ditty-bop stuff...

<ab4bc@ix.netcom.com> wrote:
[...]
>So I say CW channel coding is ternary, not binary.

Peter,

Here's a little more on the binary/ternary issue.

Consider that Morse can be defined in binary this way without mixing
up the definition of modulation and code:
Signaling elements: a unit (dot) length pulse and a unit length
silence. Let's define the pulse as a 1 and silence as 0.
The code:
A: 10111000
B: 111010101000
C: 111010111101000
D: 1110101000
E: 1000
F: 101011101000
G: 111011101000
H: 1010101000
I: 101000
etc.

Looked at this way, Morse has some interesting properties. Notice
that every character starts with a 1 and ends with 3 zeroes.
Hmmmm....kinda like TTY. In fact, you could take this code and
modulate using binary FSK instead of OOK. Or use binary PSK. Not
saying you ought to, just that you could.

This is just as much a binary code as ASCII, just a different one.
So, my conclusion is that you can certainly define Morse as a binary
code if you want to. I suppose you can also define it as ternary (or
whateverary) if you want to. (I'm just not quite sure why.)

On the matched filter issue: wouldn't a matched filter for 20 wpm
Morse have a bandwidth of just 33 Hz? Well, at least that's the
frequency of the dot clock in the keyer so that is the baud interval.
My FT1000D's 250 Hz filter doesn't come close to being matched for
that.

But all this is dangerous thinking. Next, it may lead to someone
designing a really good software decoder for Morse for all the new
5wpm Extras. ;-) ;-) (Lord knows I need one.)

Hello Bill,

Yes, we will send all of the dealers new eproms for the stock currently on the shelves. Any new units shipped will have the upgrade installed.

NOTE: Any DSP-5999zx sold 1/1/200 and later can apply for a free upgrade to the 5.1 upgrade just announced. We need a copy of the receipt and the serial number of the unit. For those who want to check their current revision and serial number, do the following:

1) SHIFT + MODE
2) SHIFT + MODE (Unit now shows SETUP mode (and light))
3) Turn left knob to "About"
4) Depress left knob and read serial number and current firmware revision level.

I have two corrections to the above (Hit SEND button instead of SPELL CHECK)
sri

1) The upgrade level is 5.0, not 5.1

2) The qualifying date for free upgrades is 1/1/2000 NOT 1/1/200. (If you have
one purchased in the year 200, Please contact me as soon as possible).

Any questions, see the web site <http://www.timewave.com> for the latest news
and the manual supplement, which will appear shortly.

PTT / serial port is MUCH more reliable... be sure and isolate the rig
via a transistor (2n222) or optical isolator. Both circuits are widely
published on the net.
I also found that an on/off switch at the computer end helps to keep
the serial port from keying the xmitter when booting or running other
software.
(I actually switch out the PTT and both audio lines.... nice to be able
to disconect the to pieces of equipment!)

Sure - the ones that were based on the Alexanderson (and I know
I've really messed up the name...) alternators, and related
spark-era equipment, but the device specified by the original poster
wasn't in that catagory - and the alternator certainly would be
a major home-brew project, as opposed to a simple interruptor-style
transmitter.

> to do a certain amount of band pass filtering.

Yes, the mental DSP is pretty well known. Under some circumstances, I can copy a weak CW signal byt ear better in a 2kHz bandwidth than I can in a narrow bandwidth. Most OOK CW signals in the amateur service have pretty sharp rise and fall times so the keying sidebands do extend up and down the band a bit. Keeping them in the passband does add to intelligibility. Narrowing up the bandwidth eliminates some of the keying sidebands, and thus eliminates the keying "presence" to me. My mental DSP is able to select the desired audio tone and by anticipating the rhythm, I think I am able to mentally differentiate between the keying sidebands and noise and/or QRM in the wider bandwidth.

Other than the dB lost vs more robust digital modes, there are operator factors that affect the aural decoding of OOK CW in the other direction -- mental fatigue. I can copy a CW signal right down to the noise, but it sure isn't pleasant. Most CW QSOs have a signal/noise ratio that is MUCH greater than it needs to be.

All in all, a very enjoyable, and usually inefficient, mode. :-)

For Sale:

Brand new Pervisell, Inc. Hamcom/JVFAX-compatible serial demodulator. Includes the demodulator (comparator), 25 to 9-pin serial port adapter, 25-foot extension cable with an RCA plug on the end for line-level audio output from a receiver or transceiver (you can change this), and *REGISTERED* Radioraft software (latest version) on diskette with registration codes. You just supply the receiver and computer! (486 or better).

You can check out Radioraft software at this website:

http://radioraft.free.fr/

Asking $50.00 (for the whole package including registered software) shipped anywhere in the continental U.S. (or best offer). I prefer Paypal credit card payments, or money orders.

If interested please contact core@zipcon.net before July 30, 2000. No ridiculously low offers, please (this stuff cost me well over 80 bucks). Thanks.

3108. Re: Help with PSK-31

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-18 00:00:00 UTC
From: Bob Lewis <rlewis@staffnet.com>
Message-ID: <A64d5.157$5S1.575@newsfeed.slurp.net>
Source record: 11701

The RigBlaster isn't going to do anything for his receive or off frequency problems. RigBlaster doesn't even process the received signal, only the Tx signal and PTT lines.

Assuming that the signals being received are in fact reasonably clean, something is distorting the incoming PSK waveform. Are you overdriving something in the receive chain? Do you have an amplifier or anything in the receive line or are you just connecting the receiver speaker output to the sound card line in? If you're using the sound card's mike input, try the line input instead. Mike inputs are easy to overdrive *and* they are not very clean on some sound cards. The receiver AGC can cause some distortion of the PSK signal on some receivers. Try the slow AGC position. Make sure your sound card's software mixer controls are not set wide open. Somewhere between 1/3 and 2/3 is usually best in order to keep the sound card itself from generating distortion.

Once you get the receiver cleaned up, if you still have the frequency problem with NET checked then it's probably the fault of the transceiver. Make sure the RIT is turned off or centered. Worst case, if something else is off in the transceiver you may be able to add just enough RIT to get the Rx and Tx on the same frequency and then leave it set there.

In response:

1. If the "multiple tracks" are what your description suggests to me, they may be spurious sidebands caused by an overdriven signal. A clean PSK31 signal should look like a pair of lines (a single set of railway tracks) on your waterfall display. A signal which is overdriven may display sidebands at the 3rd, 5th, ... harmonics of the modulating frequency (31.25 Hz). These look like weaker rails on both sides of the main railway track Overdriven signals are not that uncommon, unfortunately.

It may be possible that these spurious sidebands could be generated by overloading in your receive system, but that should be very easy to check. Just reduce the sound card's input audio level and the radio's receive audio level a bit, one at a time, and if the spurious signals are locally generated, they should drop in strength much faster than the main signal as

the "culprit" audio level is reduced. If all of the signals drop in strength together, then the spurious sidebands most likely originate elsewhere, i.e. they are not your fault.

These spurious signals contribute nothing to the readability of the signal, and cause QRM to other QSOs. You really don't need to squeeze every last watt out of your transmitter to make QSOs. Besides, as many RTTY operators have found out, running your finals flat-out in a digital mode like PSK31 can be injurious to their health. In most amateur transceivers, the finals are rated for intermittent service, not key-down digital signals, so in digital modes you are well-advised to keep your output power lower than you would for CW or SSB.

The basic solution to the overdriven signals problem is to reduce the audio drive to the transmitter, and to avoid any kind of audio processing or compression. Some of the best advice I am aware of on this is in the help file for G3PLX's original PSK31 program (file psk31sbw.hlp, which is contained in p31sbw108.zip), under sound-card setup. There is also useful info in the help file for WinPSK (or WinPSKse). You can find both of these, and lots of other good stuff related to PSK31, at www.psk31.com.

There is another type of spurious signal which can be generated by overdriving in the audio stages of a transmitter. If your central audio tone is at, say, 1000 Hz, one or more harmonics of the audio tones may lie within the bandpass of the transmitter's IF filters and, if generated at significant levels, can be transmitted along with the main signal and various other mixing products. The end result is that there can be several copies of the same signal at various locations on the band, at separations on the order of 1 or 2 kHz, rather than 62 Hz. This may be cured not only by reducing drive levels, but also by increasing the frequency of the audio tones coming from the sound card so as to take full advantage of the IF filtering in the transmitter. Dick Stevens, N1RCT, used to have a very good explanation of this phenomenon on his web pages (much better than I am able to give), but unfortunately it seems no longer to be there.

There is an interaction with your radio's ability to use narrow CW filters in SSB mode. For example, on my radio I can switch in my 500 Hz CW filters in SSB mode, with a centre frequency of 1360 Hz, so that's the audio frequency I tend to use for PSK31 and sound-card RTTY. If I were using the radio's 2.7 kHz SSB filters, I would be tempted to push the audio frequency up, perhaps as far as 2210 Hz, which also happens to be where the narrow filters are centred in FSK mode on my radio, and therefore where my TNC is set up to decode and encode RTTY; this is the North American standard for RTTY, and as you might guess, the choice of such "high" tones as a standard is no coincidence.

2. It is indeed possible that your transmitter is not on the same frequency as your receiver. If replies to your CQs are consistently off your frequency in the same direction, it is quite likely that you have this problem. It may be that your transceiver is not quite in alignment (RIT and passband tuning are possible culprits). This appears to be quite common, judging from the number of hams on CW, and lately on RTTY as well, who don't seem to be able

to zero-beat with the other guy (and no, we're not talking about split-frequency operation here). You can check this out with the help of a couple of ham friends. One of them transmits a CW or PSK signal to you; you then attempt to reply on exactly the same frequency; and the third listens to you both and, perhaps with the help of a frequency display like the one in Digipan, tells you how far off frequency you are.

3. As far as interfaces are concerned, I may have been unusually lucky, but I have been able to operate successfully with no attenuator and indeed no isolation between the radio and the computer. In fact, my computer is interfaced to the radio's control port via a serial cable and a level-shifting circuit, to a TNC (which is connected to the radio) via another serial port, to the radio's CW key input via a parallel port and keying transistor, and via connections from the sound card to the radio's audio input and output, all with no DC isolation, and surprisingly enough without ground loop problems. You may not be so lucky, of course. If not, for digital control lines the best solution is probably opto-isolators, but for audio lines the first thing to try is audio isolation transformers (Radio Shack 273-1374 seem to work fine). I have used these as well, but in my own case I found no observable difference in system behaviour with and without them.

If you don't have an attenuator in the transmit audio line, you have to be careful with your sound card audio output levels to avoid overdriving, but depending on your radio's audio sensitivity, it may be quite possible to work this way. If not, you need a simple two-resistor attenuator, or maybe a step-down isolation transformer might do the trick.

Again depending on your radio, you may be able to use VOX rather than wiring up a PTT interface. It works just fine for me. Mind you, I don't use VOX on SSB (in fact, to a very good approximation I don't use SSB at all) so my radio's VOX sensitivity doesn't have to be juggled to suit both modes. You do need to remember to mute the sound card's line input in the settings for the output level. Remember as well to turn off your Windows sounds so you don't send them out over the air.

Some PSK programs (e.g. PSKGNR, Logger) can use a serial port interfaced to the radio for radio control purposes to handle the PTT chores. This seems like an elegant solution to me, but it's not available in all PSK31 programs.

WM2U has some great information on interfacing for PSK at his web site (www.qsl.net/wm2u/interface.html), which is also accessible from www.psk31.com . There is also a page at the www.psk31.com website called PCErrata, which describes some of the other interfacing problems you might run into.

I hope this answers some of your questions.

ARRL and TAPR 19th Annual
Digital Communications Conference
September 22-24, 2000 - Orlando, Florida

For more information see: http://www.tapr.org/dcc

Information
Mark your calendar and start making plans to attend the year's premier

event in digital communications. The 19th Annual ARRL and TAPR Digital Communications Conference will be held September 22-24, 2000, in Orlando, Florida - just minutes from the Orlando International Airport.

The ARRL and TAPR Digital Communications Conference is an international forum for radio amateurs in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results,

and practical applications. The Digital Communications Conference is not just for the digital expert, but also for digitally oriented amateurs of all levels of experience.

A Conference for the Beginner as well
The conference is not just for the digital expert. As in years past an entire session strand with beginning, intermediate, and advanced presentations on selected topics in digital communications will be offered. Some of the topics will include: APRS, Satellite Communications, TCP/IP, Digital Radio, Spread Spectrum and other introductory topics. Come to the conference and hear these topics presented by the experts!

Area Attractions
The Orlando Florida area is famous for its attractions and vacation spots. Disney World, Universal Studios, and Sea World (just to name a

few) are within 15 minutes of the hotel. Shuttle service from the hotel will be available for a small fee. Cape Canaveral and Cocoa Beach are a 30 minute drive East of the hotel.

Symposia, Seminars and Banquet
Two symposia/seminars will be held which allow those with additional time and interest to make the most of the Conference. For those who may have interest in just one symposium or seminar, registration for the conference is not required to attend these activities. This allows

maximum flexibility for those who may want to participate during the Digital Communications Conference, but do not have an entire weekend to devote to the event.

The Fourth APRS National Symposium will be held on Friday and will be moderated by Steve Dimse, K4HG (the developer of javAPRS). It will likely include many APRS software authors, such as Bob Bruninga, WB4APR (the father ofAPRS), Keith Sproul, WU2Z, Mark Sproul, KB2ICI (the developers of MacAPRS and WinAPRS), Brent Hildebrand, KH2Z (the developer of APRSPLUS), Mike Musick, N0QBF (developer of PocketAPRS), and other nationally known APRS leaders. Join this group for the afternoon and evening for in-depth discussions and presentations on the current and future status of APRS. This is a unique opportunity to

gain insight into this fast-growing digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning System).

On Saturday night the DCC Banquet will be held. A guest speaker will speak after the banquet and a prize drawing will top the evening. The

Grand Prize is a Palm VII Personal Digital Assistant.

The Sunday morning seminar will be focused on PIC development, design, and programming. This five-and-a-half hour seminar will focus on the things you need to know now in order to understand and begin to

participate in PIC development.

Co-Hosts
The 2000 ARRL and TAPR Digital Communications Conference local co-hosts will be Lake Monroe Amateur Radio Society (http://www.qsl.net/lmars/),Orange County ARES/RACES(http://evcom.net/~jvoisin/ares.htm), Seminole County ARES/RACES (http://wwww.geocities.com/capecanaveral/launchpad/4773), and Orlando Amateur Radio Club(http://www.oarc.org/).

International Co-Hosts PRUG (Packet Radio User Group of Japan) will be

the International co-host for a third year running. PRUG will be hosting an informal social Friday evening before their seminar and symposium is held. Visit http://www.prug.or.jp for more information about PRUG.

Call for Papers
Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. Papers are due by August 7th, 2000, and should be submitted to

Maty Weinberg, ARRL
225 Main Street
Newington, CT 06111

or via the Internet to

lweinberg@arrl.org

Information on paper submission guidelines are available on-line at

http://www.tapr.org/dcc

Hotel
Conference presentations, meetings, and seminars will be held at the Orlando Airport Marriott. It is highly recommended that you book your

room prior to arriving. A special DCC room rate of $89/single and $89/double per night has been blocked for 50 rooms and is available until September 1st, 2000. Once the 50 rooms have been reserved, room

rates will increase. So be sure to book your rooms early! The hotel provides transportation to and from the Orlando International Airport.

Please contact the hotel to arrange specific transportation needs.

Orlando Airport Marriott (conference hotel)
7499 Augusta Drive
Orlando, FL 32822
Phone 407-851-9000, Fax 407-857-6211
(http://marriotthotels.com/MCOAP/)

What you can expect at DCC 2000
- A full day of papers and breakouts for the beginner to the advanced
- Two seminars/symposiums
- The fifth annual Student Paper session.
- A banquet with Special Guest Speaker.
- Informal get-togethers throughout the weekend.
- TAPR Membership Meeting
- An event at which the most important new developments in amateur digital communications are announced.
- Digital 'movers and shakers' from all over the world in attendance.

There are few activities where your participation can be so much fun and important! What a great way to share and renew your enthusiasm for

digital amateur radio! A get-together with colleagues and bringing each other up to date on your latest work -- all this, and more, for an unforgettable weekend of amateur radio and digital communications. We hope to see you at the ARRL and TAPR Digital Communications Conference on September 22-24, 2000!

Full information on the conference and hotel information can be obtained by contacting:

Tucson Amateur Packet Radio
Phone: (940) 383-0000.
Fax: (940) 566-2544
Email: tapr@tapr.org

I think he's talking about multiple sets of signals on his receive display which means the distortion must be in his receiver or sound card (unless of course everyone he has copied is over driving).

i don't know of that sound card but if you have the driver for it just
go under control panel, add new hardware,click next,next again, then it
will ask you install from list below,click no then next, then windows
will ask you if you would like windows to fine it click no then next
the next window you will see look for the hardware you are trying to
install which is the soundcard click it or "if you are trying to
install a modem" and windows will bring up a data base when this come
up click hard disk if you have the driver on a 3 1/2 disk this will
take you to the 3 1/2 disk just click the driver you need it should
install the driver at this point. first i would let windows try to
install it. windows program will config the driver if you are not sure
on how to do this fine someone who know about install driver or config
them they will know what to do .

3114. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-18 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <8l127a$h8g$1@news.hawaii.edu>
Source record: 11796
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.digital.misc

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH6O, jeffreyh@hawaii.edu, or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any amateur radio-related message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the

group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas. PLEASE BE SURE TO SAVE THE WELCOME MESSAGE YOU RECEIVE AFTER SUBSCRIBING -- IT WILL CONTAIN IMPORTANT INFO REGARDING UNSUBSCRIBING!

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send an email to cq-contesting-request@contesting.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's

headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

What I want to do is in real time, bandpass filter this 12Khz input
signal to the soundcard and send it back out the soundcard. I'ld need a
bunch of samples to work on, while the next bunch is loading up.
I was hoping to use VisualBasic. I'm just a beginner in C/C++, but this
might be a project to learn alot about C/C++, so I'ld be willing to try.
I'm an analog, DC to light guy, with some programming background.
Ultimately, I want to make a PC shortwave radio where as much processing
as possible is done in the PC.
I searched on Tsound, but not much, I'll look again.
Appreciate your help and anything new I can learn from you.

Hi all! Here's my problem:

I have built several interfaces so far - I am using Digipan and a Toshiba 2595CDT laptop. Recieving is OK but I have noticed multiple 'railroad tracks' of the same QSO. Thinking it was an interface issue I have built several , improving each as I go - or at least trying to. I have yet to have a successful contact - but I am putting out audio as evidenced by my power meter. So my questions are -

1. What might be the cause of the "multiple QSO reception"? they seem to be spread about 200hz or so apart and at lower strength as you go out from a "center" signal.

2. I can understand not getting a contact if I'm not on freq. , but I must wonder if I am putting out a signal at a the appropriate frequency. I have called CQ a few times and I seem to get a reply slightly to the side of the selected freq. Any idea as to the cause of this?

3. Any other info would be gladdly accepted.

Thanks!!!

Many soundcards are notoriously easy to overdrive and then they distort like mad. Perhaps what you are seeing is the result of distortion in your soundcard - if so, your interface has nothing to do with what you see.

Try running your soundcard at the lowest possible output level. Check the waveform with a scope with the program in IDLE. You should see a sinusoidal two-tone pattern on the audio. Check your r-f output envelope - should be the same two-tone. Any clipping, flat-topping or other distortion is quickly seen on the scope. If your soundcard is "Economy Class" to borrow an airline term, you might need to invest in a better one

What radio are you using--older tubers and hybrids will drift,and w/1 hz tuning,this can cause a major problem....

And check your sound card settings,on both TX and RX and level them up to where you are recieving copy when you click on a signal,and,putting out rf.

Also,make sure you don't have the squelch threshold set too high.

Finally,using Digipan,the AFC should be clicked on,(and the SNAP helps tune in signals as well).

The HELP files should cover most of this.

See you on PSK910/15/17M)

Short answer: Use a separate sound card, separate modem. Give the soundcard modem a decent Viking funeral, with extreme prejudice.

Long answer: Soundcard modems are also known as combo cards, and they are the devil. The modem section is inevitably a "winmodem," designed to tap the CPU to do the job of an actual modem. The result is a modest savings in the cost of hardware, and mediocre performance. Unfortunately they also require Micros~1 Windows to function. Penguinheads the world over are trying to write so-called "linmodem" drivers, but their task is made difficult by the reluctance of hardware manufacturers to release relevant specs, which would displease the beast from Redmond.

I've had limited success with the sound card function in combo cards under Linux. The early betas of Linux PSK31 programs such as gpsk worked okay on receive, but the general performance did not fill me with confidence.

Linux plays best with real modems and real sound cards. Most external modems work fine. Hardware-based ISA modems are pretty well-supported. When I surf under Linux, the same inexpensive ISA modem I'm using now gets the job done with no problems. Compatible PCI modems are more difficult to find, as most are winmodems. Here's a modem reference that may be of some help: http://www.o2.net/~gromitkc/winmodem.html. As for sound cards, most 16-bit SB compatible cards are detected and will work under Linux. Your Linux distribution's web site will have the latest info.

Looking at the list of groups this was posted to, he is probably not
talking about a telephone modem or winmodem, but about using a soundcard
(with software) as a modem for amateur radio digital modes.

While this principally has the same problems, the modem standards used on
amateur radio are much simpler than those used on the telephone line and
a modern PC CPU has no problem at all performing this function.

To answer the question: first read the relevant documentation. It is just
a list of steps to perform.

Too much audio from your sound card into the transmitter. If your rig
has an ALC meter for this purpose, use it. You don't want any ALC when
working PSK31 (which requires a linear transmitter).

Perhaps your transceiver has an offset between transmit and receive?
Could be quite likely if it is old.

No offense intended, but the RigBlaster is the ultimate demonstration
of an appliance operator.

The interface I built for my radio consists of two small transformers,
a diode, 4N25 optocoupler, a pot and a couple of resistors. Not rocket
science.

3126. Getting back into packet -- need info please

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-19 00:00:00 UTC
From: "Joseph R. Skoler" <joseph@compuhelp.com>
Message-ID: <8l4610dih1@news.panix.com>
Source record: 11714

Hi,

I dropped out of packet radio in the late 1980's, and have been thinking about getting up and running again.

I live in Manhattan, but I have a weekend house in Sullivan County, NY -- where I can erect antennas and play all I want (;-)

I've been searching the web for info to get back up to speed, but all I see is continued reference to 1200bps traffic and 9600bps backbones.

Has there been any progress?

My second questions is: I found NEDA's map and a couple of other maps of nodes, but I see nothing in my area. I was hoping to link my residences, but it's a bit over line-of-sight (about 100 miles with mountains in between). How can I find out what nodes are around me, and, is there fast traffic (56K, perhaps).

I hear some traffic on 145.73 & 144.39, but that's it.

It's a little surprising that we're stuck at low speed -- I own an ISP, where
we deal with DSL lines up to 7mbps down by 1mbps up.

Thanks very much for your help,

Joseph R. Skoler, kc2yu
joseph@compuhelp.com

Seems that TNCs are PASSE with the new digital modes taking over. They are effective and they are cheap.

If all these modes were standard and not proprietary then it might be worth it but I see AMTOR dead, PACTOR dying and the rest never got off of the ground due to licensing and such.

Does it have galvanic isolation at the computer connector, like Hamish'
interface has? (transformers, opto coupler)

Well, looks like it's a consensus: Packet did not bloom into the wonderful thing I had hoped it would.

Thanks everyone for the feedback.

..... except in one respect: APRS (Automatic Position Reporting System).
APRS is very much alive and well. Here's a brief summary:

====================
INTRODUCTION TO APRS
====================

What is APRS?

APRS is short for Automatic Position Reporting System, which was
introduced by Bob Bruninga, WB4APR, at the 1992 TAPR/ARRL Digital
Communications Conference. Fundamentally, APRS is a packet
communications protocol for disseminating live data to everyone on a
network in real time. Its most visual feature is the combination of
packet radio with the Global Positioning System (GPS) satellite network,
enabling radio amateurs to automatically display the positions of radio
stations and other objects on maps on a PC. Other features not directly
related to position reporting are supported, such as weather station
reporting, direction finding and messaging.

APRS is different from regular packet in several ways:

* It provides maps and other data displays, for vehicle/personnel
location and weather reporting in real time.

* It performs all communications using a one-to-many protocol, so that
everyone is updated immediately.

* It uses generic digipeating, with well-known callsign aliases, so that
prior knowledge of network topology is not required.

* It supports intelligent digipeating, with callsign substitution to
reduce network flooding.

* Using AX.25 UI-frames, it supports two-way messaging and distribution
of bulletins and announcements, leading to fast dissemination of text
information.

* It supports communications with the Kenwood TH-D7 and TM-D700 radios, which have built-in TNC and APRS firmware.

Conventional packet radio is really only useful for passing bulk message traffic from point to point, and has traditionally been difficult to apply to real-time events where information has a very short lifetime. APRS turns packet radio into a real-time tactical communications and display system for emergencies and public service applications.

APRS provides universal connectivity to all stations, but avoids the complexity, time delays and limitations of a connected network. It permits any number of stations to exchange data just like voice users would on a voice net. Any station that has information to contribute simply sends it, and all stations receive it and log it.

APRS recognizes that one of the greatest real-time needs at any special event or emergency is the tracking of key assets. Where is the marathon leader? Where are the emergency vehicles? What's the weather at various points in the county? Where are the power lines down? Where is the head of the parade? Where is the mobile ATV camera? Where is the storm?

To address these questions, APRS provides a fully featured automatic vehicle location and status reporting system. It can be used over any two-way radio system including amateur radio, marine band, and cellular phone. There is even an international live APRS tracking network on the Internet.

APRS Features

APRS runs on most platforms, including DOS, Windows 3.x, Windows 95/98/2000/NT, MacOS, Linux and Palm. A new version for WinCE is due for release soon.

Most implementations on these platforms support the main features of APRS:

* Maps -- APRS station positions can be plotted in real-time on maps, with coverage from a few hundred yards to worldwide. Stations reporting a course and speed are dead-reckoned to their present position. Overlay databases of the locations of APRS digipeaters, US National Weather Service sites and even amateur radio stores are available. It is possible to zoom in to any point on the globe.

* Weather Station Reporting -- APRS supports the automatic display of remote weather station information on the screen.

* DX Cluster Reporting -- APRS an ideal tool for the DX cluster user. Not only is it possible to see all DX spots on the map, but by operating in the monitor-only mode, the overall packet load on the DX cluster is reduced. This is a benefit to everyone on the channel.

* Internet Access -- The Internet can be used transparently to cross-link local radio nets anywhere on the globe. It is possible to telnet into Internet APRS servers and see hundreds of stations from all over the world live. Everyone connected can feed their locally heard packets into the APRS server system and everyone everywhere can see them.

* Messages -- Messages are two-way messages with acknowledgement. All incoming messages alert the user on arrival and are held on the message screen until killed.

* Bulletins and Announcements -- Bulletins and announcements are addressed to everyone. Bulletins are sent a few times an hour for a few hours, and announcements less frequently but possibly over a few days.

* Fixed Station Tracking -- In addition to automatically tracking mobile GPS/LORAN-equipped stations, APRS also tracks from manual reports or grid squares.

* Objects -- Any user can place an APRS Object on his own map, and within seconds that object appears on all other station displays. This is particularly useful for tracking assets or people that are not equipped with trackers. Only one packet operator needs to know where things are (e.g. by monitoring voice traffic), and as he maintains the positions and movements of assets on his screen, all other stations running APRS will display the same information.

Where to hear APRS transmissions

One of the biggest benefits of APRS is that it only uses one frequency to work on -- everyone shares it. In North America, this is 144.390 MHz. In the United Kingdom and several European countries it is 144.800 MHz.

Where to find out more about APRS

These web sites have a wealth of information on APRS, including documentation and sources of software:

http://www.tapr.org
http://www.aprs.org
http://www.dididahdahdidit.com
http://www.packetradio.org.uk

The full APRS Protocol Specification is at:
http://www.tapr.org/tapr/html/Faprswg.html

Hello Gil,

Binaural CW is not a proprietary mode. Binaural is a technique that uses DSP processing to process the signal, perform some DSP magic and then spread the tones, high and low between the left and right speakers of a stereo headset. This technique improves your ability to copy and makes coping much less strenuous. There are no proprietary modes in the DSP-599zx, RTTY, PSK31 PACTOR are standard mode on the airs. We do provide special filters for CLOVER and the DSP-599zx user has the ability to "set-up" special filters for experimenting.

You are correct in asserting the lack of impact of the propriety modes on the air today. Several companies have invented (and re-invented) modes that require a special license to other manufacture to be supported. With the exception of a few message handlers it has not made a significant entry onto the bands. On the other hand, PSK31 is the one new mode that has captured the digital communities attention, in part because of the low power and small antenna stations' success with the mode.

Nope, old-fashioned ohmic all the way. No ground loops, no feedback, no
60-Hz "hum" - it just works! Comes, I guess, from matching a good
computer to a great radio. R-F output envelope is a textbook two-tone.
IMD measured in the lab for the system is -35 to -38 db on 20 meters.

Hi Joseph. Most (maybe all) of the APRS client software packages let you
interface a weather station to them. The software then formats the raw
output from the WX station and transmits it as APRS-conformant packets.
You can also set up WX "objects" (for example, to show the position of a
storm), and other people will see the objects on their maps.

Well, packet just needed an application which was unique, somewhere
where it excelled. Email is much better on the Internet; packet can't
compete. Packet will only be better for mobile applications where
wireline isn't available.

APRS is a good example of such an application. Not that current
APRS software is state of the art, but it's a start.

I have gotten the bug to play on HF Digital so I dug out my OLD PK232 from the garage and low and behold it still works. I find the I do not reconise all the digital stuff I am hearing out there.

1) Are there still RTTY nets that happen at a regular time daily, weekly or a freq there I will usualy find RTTY?

2) I found what I thought was a RTTY station and I tried and tried (with a very good signal) but I think I have the baud incorrect. When I was in it before (On VHF) we usualy used 60 Word per min (45 Baud) and Mars used 100 Words per min (I do not remember the baud that goes along with that, I tried 75 baud but I still could not copy)

3) I was on 40 meters and was using LSB that is what I use for phone in that band.

4) Is the PK232 Obsolete? Is there upgrades available or should I just purchase a new interface? If so which ones are good at a resanable price?

Thanks for any help you pass along

I have an old 1200 baud TNC2 modem but I want to experiment by hooking the
radio
up to my computer using the soundcard. Detecting 1200 and 2200 Hz tones would
not
be hard. The radio (Kenwood TM-451E) is supposely 9600 ready, but you are
saying
I wont be able to detect that on the computer?

Source record: 11655

Hi Delbert,

RTTY is slowly disappearing on the HAM bands but there still is activity on 20 meters between 14.080 and 14.095 Mhz. There are also STILL RTTY contests every year!

Most HAMs use 45 baud RTTY for keyboard QSO's and contests. But almost ALL of the RTTY BBS's have disappeared. They have been replaced with PACTOR (and some AMTOR) BBS's.

If you are using AFSK (i.e. feeding tones from your PK-232 to your rig's mic jack) for RTTY, you should use LSB even on 20 meters! Also make sure RXREV and TXREV are OFF.

If you are using USB, you may have to turn RXREV and TXREV ON.

Today, most HAM's who used to operate RTTY now operate PSK31. All you need to operate PSK31 is a computer with a sound card and some FREE software. The sound card is used as a modem. For info on PSK31, see http://aintel.bi.ehu.es/psk31.html.

You may also want to try PSK Hell another mode you can operate with a computer and a sound card. The software is FREE. See www.qsl.net/zl1bpu. In my view, PSK Hell is a MUCH BETTER mode than PSK31 for DX. It is really great with very weak signals.

You can even operate RTTY with your computer and a sound card. See MixW32 and TrueTTY software.

I suspect that your old PK-232 also implements AMTOR. AMTOR is rarely heard these days but if you call CQ in AMTOR FEC, you will get some replies.

PACTOR 1 and PACTOR II has effectively replaced AMTOR for BBS access. PACTOR 1 is a great mode. And Pactor II is just FANTASTIC! Data just screams along even with very weak signals.

If you want to operate PACTOR II, you must buy a SCS PTC II or PTC IIe. To my knowledge, SCS who developed PACTOR II has not licensed the protocol to any other manufacturer. But the SCS TNC's are pricey. See www.scs-ptc.com

You can upgrade the firmware in the PK-232 for PACTOR 1 at a nominal cost. But you cannot upgrade the PK-232 to PACTOR II. It is technically impossible without drastically changing the hardware even if SCS granted a license.

Timewave bought AEA a few years ago. For info on upgrading your PK-232 see www.timewave.com. For additional $$$, you can even upgrade the filters used in the PK-232 to DSP based filters.

You really need a TNC like the PK-232 to operate the BURST modes like AMTOR and PACTOR. It is my understanding that it is technically impossible to develop a program that will run UNDER WINDOWS that will use your sound card as a modem to operate the BURST modes like AMTOR and PACTOR 1. To my knowledge, no one has done it. You must use another operating system. But since most Ham's use Windows and run logging programs etc under Windows, the simple solution is to use an external TNC for the BURST modes.

Is the PK-232 obsolete?? Well, these days a lot of HAM's are selling them on EBAY (and HAM's are still buying them for $100 US or so). You be the judge.

No I am not saying that... because of the low-frequency requirements
(remember, it does not use tones) it will not work very well, but it can be
done. Software exists that does it.

Source record: 11657

You might try the ARRL station for rtty. YOu should be able to find the schedule on their web site. They start out at 60 wpm (45 baud) rtty and sometiems switch modes. Don't recall what they switch to. Set the rig to lsb and depending on the softwear you might have to switch from normal to the reverse mode. RTTY can be received in either sideband , but you have to change the mode of the softwear or the demodulator from normal to reverse. Best other place is from about 14080 to 14100 on 20 meters to get the random rtty ham stations. Most will be using 60 wpm. The normal mode for the low bands is to use the audio tones into the audio input and use lsb if using an audio input/output type of modulator/demodulator.

YOu might also want to try some of the sound card softwear. Especially the psk31 that is a hot mode for now. Just plug into the audio of a sound card. While using the sound card softwear don't use the usual 2125/2295 vhf tones, but try some with a mark tone of around 1000 to 1500 hz. They seem to work beter there. Psk31 sounds like an unstable carrier and can be found around 14.070 on 20 meters and is usually worked in the usb mode.

Look here for some softwear.

http://www.muenster.de/%7Ewelp/sb.htm

While some of it is for DOS it may work in windows 98.

RIGBLASTER is VERY EXPENSIVE for a SIMPLE circuit that you can build for a fraction of the price!!

Save yourself a lot a money and build yourself your own interface at a much LOWER price EVEN IF you use the typically over priced parts sold at RadioShack. You should be able to build an interface for $10 to $15 US.

It is my understanding that the CD that comes with RIGBLASTER contains software that you can download off the internet. Considering that updates to much of this software happens VERY frequently, don't be surprised if the software on the CD-ROM is out of date.

Furthermore, it is my understanding that the purchase of a RIGBLASTER unit does NOT grant you ANY licences to ANY software. They are EXTRA on top of the HIGH selling price. If I am wrong, someone please correct me.

In my view, it would be better if you build your own interface and with the money you saved support the hard working HAMS who developed the software by purchasing software licences.

>RadioShack. You should be able to build an interface for $10 to $15 US.

True I suppose, if you want to do that. I like the ability to be able
to use my mic at any instant, the RIGBlaster let's you do that without
having to unplug your homemade cable.

>It is my understanding that the CD that comes with RIGBLASTER contains

Possibly true, however it will still work and you can still
register the software with the author.

I have not seen the ads for one, but from what I understand from reading here the rigblaster is just an interface for the audio and maybe a cd with some programs on it. YOU might want to look at this web site for some free softwear that uses the sound card.

http://www.muenster.de/%7Ewelp/sb.htm

I have been using some of the programs some work very well (especially the psk31 programs). The rtty programs dont seem to work nearly as well as the old ST-6 demodulator I built, but don't cost as much either. The do fine as long as the signals are in the clear and are not fading in and out.

RigBlaster provides an isolation transformer and adjustable attenuator for the transmit audio (sound card to transmitter) and a keying circuit to convert the serial port levels to a PTT for the transmitter. The received audio (rig to sound card) does not pass thru RigBlaster.

Its biggest benefit is automatic switching between the mike and sound card. It's easy to hook up *but* you can build a sound card to rig interface with about $10 worth of parts from Radio Shack.

3171. New PSK31 site to promote digital ham radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-22 00:00:00 UTC
From: kf4sir@earthlink.net
Message-ID: <3979aa17.14192719@news.earthlink.net>
Source record: 11750

Hi all, I have been busy during any free time I can find working on a new web site to try and promote digital ham radio.

Hope to stir interest in experimenting with Pactor, PSK31 and maybe RTTY for possible emergency use and maybe setup a NTS sub. section if any interest.

The site is still under construction but has about 70% of the planed content up now. (Hope to start working on the graphics soon and make it look better).

Goal is to try and figure out ways that PSK31 could be used to relay messages and try and foster better understanding between Pactor and PSK31 operators by getting hams to try the other mode.

http://psk31relay.net

Thanks and suggestions welcome.

I think the above quote might express a common attitude problem from the "old" people. The old school HAM clubs in my area is full of people that thinks HAM is about HF and the VHF/UHF is just the beginner bands where you only stay until you got the license for the _real_ bands.

But isn't it a fact that creating those digital gateways to internet is just as challenging as what you are doing? Operating them might look so simple from the outside, but you are forgetting all the work it took to get there.

It might not be the same objective as the HF guys have. HF is about communicating as far as possible using only radio. Ok. But VHF digital is about communtication as fast as possible using the band as efficiently as possible and in many case as far as possible too ("far" here is just measured in tens of kilometers instead of 1000's but it can be as hard to archive).

It is most often _not_ about saving some money by using the neighbours DSL line. The equipment needed for this is so expensive that you could buy 10 DSL lines just to get you connected at some lousy lower speed. Also the "but I have internet home" argument is the same as "but you could just call the guy over the phone" argument.

As I see it we have a split in the community with HF people, UHF/digital people and a few people doing both. And as long as one or both of these groups has this attitude that the other form for radio communication isn't really radio (what you said in the quoted) you will enforce that split.

Now it is no secret that young people want to try the new and unexplored. They also want fast internet access, and it seems logical to combine your hobbies if you can (your internet activites with your HAM

activities even if that isn't the cheapest or easiest way). So I say the UHF/digital people are going to get the new blood. If the HF people keep telling them what they are doing is not _real_ radio, do you really think that will keep them from doing it? - no let me tell what they will do: they will think old idiots playing with their pre WW-II toys. We will just stay away from them and mind our own business.

In fact, that is what I am doing. I am not staying away from the local HAM clubs because I think HF is lame. I am staying away because the people in those clubs thinks my attempts at creating a digital highspeed link is lame, and I generally don't like to be around people that think I am lame. And half of them thinks my factory build 70 cm tranciver is lame too fully ignoring that none of them have the skills to actually build a 70 cm tranciver.

Highway robbery! $80 US is over $130 Australian dollars, my interface
cost me less than $15. Two transformers, a 4N25, a 1N914, a couple of
resistors and a few plugs.

> True I suppose, if you want to do that. I like the ability to be able

Doesn't your rig have an accessory socket? Use it -- no need to
interface your rig to the mic socket.

Personally I would be very embarassed to admit I could not build
myself a circuit to do this.

You could use this argument for just about anything. Of course it is
possible to build anything. Sometimes it is even cheaper. Capitalism
demands that we buy it, rather than build it.

What most Monarchists don't understand about Americans, is they
like to spend money. Money to most Americans is like a full bladder.
That's why everything is big (BIG!). Our parking lots at Wal-Mart are
larger than most cities of the World.

We drive cars (we used to call them trucks) that are big (BIG!) and
our horns make real big (BIG!) sounds (none of that wimpy Queen
sound from the British colonies).

The quickest way to an Americans wallet, is to make it BIG! Even
our toothpaste box is big (BIG!) even though the tube of paste only
takes an eighth of the boxes internal volume.

P.S. $80 is chump change. We spend that much on gas and burgers.

At the distance you will get 10 Mbps to work reliably, you could
use a Part-15 Spread Spectrum radio.

There's really only one 56 kbps design available. It is marketed by
a TNC company in Florida. They sell half the product. The other half
has to be found at computer swap meets. The first half costs about
$1300 (TNC/DMA, Modem, and antenna).

Really? My WA4DSY stations cost a total of about $600 each -
for the modem, 219 Mhz transverter, antenna, power supply, and
SCC cards - all new equipment.

Where in the world do you get a cost of $1300.00?

- Rich

I have built circuits in the past because I enjoy doing it or can not find a comercial product that will do what I want,or I don't have the money. I put together a 'glass' rtty station many years ago out of some junk computer boards because I could not afford to buy the stuff already made. This was back before the Modle 3 came out from RAdio Shack. Had about $ 50 in a system, but took about a year to build it and write the program for it. But that $ 15 cost you have in your interface, look at all the other things you have to have. I am sure you put it in a box and had to drill some holes. Count all the drill, bits, soldering equipment and other tools you used and see how much it costs. Sort of like the fisherman that save money by fishing. They don't count the cost of the boats, hotel rooms and such.
"free fish" only $ 100 per pound..hihi..

Just as most hobies require it, ham radio really requires the hams to have a swr meter and soldering equipment to put connectoors on, but I doubt that most have them, especially the ones that just operate on the FM modes on the vhf bands. Probably quiet a few that operate the low bands don't have a soldering gun so they can hook up their coax or mic connectors.

A DPL Micor will probably do what you want; the standard Micor
VHF Mobiles are PM (using the Serrasoid modulator at that),
but the repeaters and DPL Micors have a different channel element
(with an additional pin for direct-FM). You can retrofit a
4-pin channel element to a PM Micor but you have to make sure to
apply the modulation to the pin (at least one person reported
success with this but said it wasn't worth the trouble).

Hi Ralph,

You obviously do not know what is involved to make an interface. For most Hams just using VOX and two cables with a audio isolation transformers will work just fine!

For this interface, all you do is cut each cable and splice in the audio isolatrion transformer. You can even use electrical twist clamps. You DO NOT EVEN NEED TO SOLDER! Of course, it is preferable if you used a soldering iron. (Soldering irons are very inexpensive. -- Typically $10 US for one that will do the job).

Alternatively, you can build an interface on a proptotype circuit board where you just push the wires into the board. No soldering.

Even if you bought a new soldering iron or used a protptype board, the cost of building your own interface is LESS than a THIRD of the cost of a RIGBLASTER.

In my view, RIGBLASTER is very expensive considering the small number of electrical components involved.

Considering the apparent popularity of RIGBLASTER, I do not think it won't be long before someone else, like MFJ, makes a similar interface at a fraction of the price. If you can't build one, personally I would wait for some REAL competition to appear in the market place.

Personally, I wouldn't purchase a RigBlaster to use with PSK31. I can and have built something simpler and less expensive (I've never even had the need to use an isolation transformer). However, if I expected a nice box with custom silk screened labels, a custom PC board, a printed manual and to pay someone else to put it together for me then I think $80 is reasonable and fair. Oh, and don't forget the cost of advertising (nothing sells very well without it).

RigBlaster is also designed to handle things like a voice recorder playback and slow-scan where you need to instantly switch between the mike and the sound card. It's overkill if all you use it for is PSK31. But hey, people purchase 400 mhz pentium computers every day to run their word processor and to log onto the Internet at 33.6 K.

Radio-Shack used to (still?) sell a Microwave Oven leak detector
for over $30 that consisted of a microwave detector diode and a meter.

Skateboards have fewer parts, and are just as expensive.

What you say has nothing to do with marketing.

Marketing anything to Hobbyists (of any type) is going to produce
products that cost more than a mass-market. Figure the best case.
How many of these do you think they can sell? 3k? 5k? I think that
is stretching it.

How many products have you brought to market? You seem to
present yourself as a better businessman. Why is that? Do you
have an MBA? What University is it from?

Rather than competition, don't you think the radio manufacturers will
implement the design internally? Too few parts? Too little profit?

Steve,

Hmm.... Let's try to compare apples with apples..

MFJ has been selling for years a packet TNC/Radio switch box for $39.95 US.
This switch box also has a nice silk screened circuit board with jumpers etc
in a nice metal box.

The RIGBLASTER unit is similar. RIGBLASTER is essentially a TNC switch with
a few extra parts to interface the PC to the rig. None of these extra parts
are very expensive. I would expect that the cost to build both units to be
around the same give or take a few dollars.

Both units are also advertised extensively.

I highly doubt that these MFJ switches outsell the RIGBLASTER interfaces.
It is more likely the other way around!

Considering the selling price of the MFJ packet switch sold in the same
market, I think a reasonable price for a RIGBLASTER unit would be between
$40 and $50 US, if not lower. But when there is lack of any real
competition, you can charge almost any price. Isn't that part of the
American dream?

Now, what do you think?? Is RigBlaster too expensive??

Expensive to me is 99 cents for sunflower seeds, or 99 cents for a 20 oz
coke. Even heroin has gone up to $15! ...it's the end of the world...

Steve

Funny that you mention that. I have always proclaimed that advertising
increases product prices, but the guys from advertising agencies think I'm
nuts and that prices would increase tenfold when advertising wouldn't
exist. Like you, I fail to recognize how that could be true.

<deletia>

Creating a "digital gateway" is trivial.
It always has been trivial.
The software to do it has been available since 1984.
You load the software, set your ip addresses, and
that's it ... you have a gateway!

The only "ham radio" part is connecting the radio to the
TNC and antenna. You can buy premade cables for this ...

Others have already published many interfaces on the web.

See the following:

http://www.qsl.net/wm2u/interface.html
http://www.w5bbr.com/soundbd.html

If you are lucky, you may NOT need any interface circuit. Try connecting your sound card to your rig directly and use VOX.

If you experience ground loop problems, then use audio isolation transformers on each line between the rig and computer's sound card.

If the audio levels are too high, use a resistor or POT on the audio lines.

If you want your computer's serial port to key the rig use the simple opto isolator circuit shown on the web pages above. If you use the simpler one transistor, one diode and one resistor circuit, you will defeat the purpose of using the audio isolation transformers in the first place to break up the ground loops.

If you really want to isolation you can use opto isolators also on the audio lines. I don't think RIGBLASTER does this. But such a circuit can easily be made. G3VFP has recently made such a circuit.

I highly doubt that MFJ is selling their simple TNC switch at cost.

If what you say is true then West Mountain Radio will quickly be put out of business when someone else, like MFJ, starts selling a sound card interface at a lower price.

But I think West Mountain Radio will more likely just drop their price.

I don't think it will be long before someone starts selling a similar interface. Let's see what happens!!

I have to disagree regarding the RigBlaster and MFJ TNC switch box being similar in complexity. I have both units. The MFJ is nothing more than a box with one switch, some jumpers, 4 capacitors and some connectors. The RigBlaster is far more complex, having one active component (4N33) requiring a power transformer, 2 relays, 2 transformers, 10 resistors, 1 potentiometer, 2 switches, 12 diodes, 9 capacitors plus jumpers and connectors. The construction on the RigBlaster is also superior to the MFJ. Just based on a comparison with the selling price of the MFJ, I would say the RigBlaster is worth at least twice, and maybe three times the MFJ. Both units work well for their intended purpose, but you really cannot compare them.

Part 15 network cards can be had for as little as $120(maybe less).
Getting hooked up to DSL/cable modem is going to cost you that or more
just to start - and then $39.95/mo thereafter.

This one is ideal for those who want to use low level constant outputs
from the Icom accessory connector. It has an op-amp in the receive
line to provide some gain. I use a very similar circuit between my
IC761 and PTC-II.

Yes, RIGBLASTER uses one opto-isolator on the RS232 line to key the rig's PTT line. Not a big deal at all.

Instead of using a transistor, you use a opto-isolator to key the PTT line. The circuit is simply a 4N33 opto-isolator, one or two diodes, and one resistor. It provides better isolation and costs only a dollar or so more than the transistor keying circuit. See www.qsl.net/wm2u for a simple circuit.

BUT RigblASTER does NOT use any opto-isolators on the audio lines between the sound card and rig. I think you will find that RigBlaster simply uses audio isolation transformers. Audio isolation transformers will work fine but do not provide the same level of isolation and protection as opto-isolators. For the price of a RigBlaster, you would have thought that opto-isolators would have been used throughout. It would not have cost much more.

Dick,

I think you will find that RigBlaster does NOT use a power transformer to power the 4N33 opto-isolator. The transformers in RigBlaster are more likely audio isolation transformers used to break up any ground loops on the audio lines to and from the sound card.

It is my understanding that RIGBLASTER only uses one opto-isolator for the PTT keying circuit. Instead of a transistor, an opto-isolator is used. Most opto-isolator PTT keying circuits consist of one opto-isolator, one or two diodes and one resistor. Not very complicated at all. For an example of such a circuit, see www.qsl.net/wm2u

Personally, I would have liked to have seen opto-isolators used NOT ONLY on the PTT keying line BUT ALSO on BOTH of the audio lines to and from the sound card. It would have not cost much more.

Hi Jim,

Yes, RITTY may work just fine under Windows 95. But Windows 98 is a different story for many Hams.

Many DOS programs appear to run much better under Windows 95 or DOS than Windows 98. (e.g. CT runs much better if run from DOS not in a Windows 98 DOS box). In fact, some OEM versions of Windows 98 will not let a DOS program launched from windows to even access the serial COM ports. This can be a BIG problem for DOS terminal or communications programs or DOS programs that use the serial COM port to key the PTT line of the rig. I do not think that the OEM versions of Windows 95 ever had this problem.

(Windows 98 that came with my Toshiba has this problem. According to Toshiba, if you boot directly into DOS at startup, the DOS program can access the serial COM ports. They are right!)

By all means try running each DOS program from windows but if it doesn't work then try booting to DOS directly at startup and running the program. For many Hams that solves the problem.

Why wouldn't you use a system based on part 15 devices, for crying out loud? It is faster, cheaper, and proven. You are going to have enough trouble getting your sites set up properly, without having to worry about cobbling together a bunch of expensive and lower-performing equipment.

It does require an external 12 VDC power source to operate the
opto-isolator and the relays though. They provide a wall wart.

> The transformers in RigBlaster are more likely audio isolation
> transformers used to break up any ground loops on the
> audio lines to and from the sound card.

RigBlaster handles ONLY the PTT and Tx audio lines. Receive audio does
not pass thru the RigBlaster. Transmit audio does pass through an
isolation transformer.

> Personally, I would have liked to have seen opto-isolators used
> NOT ONLY on the PTT keying line BUT ALSO on BOTH of
> the audio lines to and from the sound card. It would have not
> cost much more.

I think it would have cost considerably more. You can't simply pass
audio through and opto-isolator. It would require proper biasing and
audio amps. Just another place to create distortion and ruin the IMD
on the receive and transmit signals. Isolation transformers are a much
more reasonable approach.

By the way, a transformer can break up a ground loop even if there are
other ground connections between the computer and the rig. If properly
connected, the transformer will prevent the ground currents from
flowing through the shield of the audio line where it causes the most
problem. Actually, even if you isolate the receive line, the transmit
line and the PTT circuit you will (I hope) still have a common ground
via the power line safety ground. The rig and the computer are never
totally isolated - if they are they you could have a shock hazard.

3208. Re: RigBlaster

Source record: 11611

Yes, if you use opto-isolators on the audio lines to and from the sound card you will need to also use op amps and the proper biasing circuitry. Such a circuit is very easy to build and design. G3VFP Has recently designed and built such a circuit. But I don't think that such a circuit would considerably add to the cost of a RigBlaster. (I am not talking about selling price but cost). The cost of the circuit board would be about the same and the extra cost for the additional parts would not be very much. If there was any significant additional cost, it would likely lie in the extra cost in building such a unit. Yes, the circuit must be designed properly but that is part of what you are paying for when you buy a commercial product.

The REAL advantage of using opto isolators is to better protect your computer's sound card from any dangerous voltages coming from the rig or vice versa due to malfunctions or improper installation.

Yes, I agree that there is always a ground connection between the computer and rig via the AC ground line. Complete isolation is not possible nor desirable. But the real goal of any sound card interface is to break up the ground loops on BOTH of the AUDIO LINES to and from the sound card and on the PTT line. Audio isolation transformers do a good job at breaking up the ground loops on the audio lines.

But some HAM's defeat the purpose of using audio isolation transformers in the first place by using a simple one transistor, one diode and one resistor circuit to key the PTT line of the rig. Such a simple one transistor etc PTT keying circuit provides a direct ground connection between the rig and computer which can cause havoc when transmitting. It is best that any ground loop on the PTT keying circuit be broken up by using a relay or opto isolator. I think RigBlaster uses an opto isolator on the PTT keying circuit.

You mention that RigBlaster does NOT offer ANY isolation on the receive audio line. That is too bad. If the Receive line is connected directly between the rig and computer, RigBlaster may not solve the problem created by ground loops. In some cases, ground loops on BOTH the Receive and Transmit audio lines NEED to be broken up using audio isolation transformers (or opto-isolators). It sounds like RigBlaster only does half the job on the audio lines.

In my view, the ideal interface would consist on two audio isolation transformers and variable POT's on the audio lines to and from the computer and a simple opto isolator PTT keying circuit consisting of one opto-isolator, two diodes and one resistor. If you don't have a packet or accessory jack on your rig and must use your rig's mic jack, then you may want to throw in a switch. For circuit diagrams see

http://www.qsl.net/wm2u/interface.html and
http://www.w5bbr.com/soundbd.html. LESS THAN TEN PARTS ARE TYPICALLY
NEEDED.

In my view, such a circuit is NO more complicated than a HAMCOMM interface
and should have a similar selling price. (e.g the selling price for a
BayPac Hamcomm style interface is $49.95. I don't think it will be long
before someone starts selling a sound card interface for somewhere between
$40 and $50 US that break up the ground loops ON BOTH of the audio lines to
and from the sound card AND on the PTT line).

This is a very risky thing to do. If something shorts in the power supply on the computer you may have 120 volt difference between the rig chassis and the computer chassis. I'd sure look for a safer solution to a ground loop problem.

I'm not sure where all this ground loop problem comes from anyway. Perhaps some of what is thought to be a ground loop is actually RFI caused by having RF on the radio chassis. I've interfaced a lot of stuff (sound cards, packet boards, TNCs, etc) to various rigs over the years without any ground isolation and never had a ground loop problem.

I think you are confusing isolation with protection.

Yes, even with optocouplers (or optoisolators) the chassis of the computer and rig are tied together via the green wire or ground in the AC wires.

But even with this common ground connection via the AC lines, audio isolation transformers and optocouplers break up the ground loops on the audio lines and PTT lie and REALLY help prevent hum etc. They do work! A lot of telephone modem manufacturers use audio isolation transformers to break up ground loops. Old telephone modems are a great source for audio isolation transformers if you can't buy new ones locally.

But optocouplers do MORE than just break up ground loops. Optocouplers also help isolate and PROTECT your computer from any dangerous voltages from the rig and vice versa due to any malfunctions, short circuits and improper installation. Audio isolation transformers don't do that. If you really want to protect your rig and computer, I contend that you should use optocouplers throughout NOT JUST on the PTT line.

Audio isolation transformers just break up ground loops. Optocouplers break up ground loops and also help isolate and PROTECT your rig and computer from dangerous voltages.

By the way you can buy or build a device using optocoupler technology to completely isolate the RS-232 connection between your computer and your KACHINA rig.

I have seen posts where HAM's contend that you canot break up ground loops on the RS-232 line. This is not true. They can be broken up using a series of optocouplers and op amps. To isolate all the 25 pins in a RS-232 25 pin connector, the device will use quite a lot of optoisolators. But since most HAM applications only use 5 or so pins or lines, a simpler device can be used.

Well, I do not think that most transmit problems are caused by RFI. Just listen on the ham bands. Hum due to ground loop problems is very common on the ham bands. But you typically cannot hear the hum unless the signal is very strong.

I once had a ground loop problem with a MIC. I only found out about it when a local station noticed the problem. When I switched the mic, the hum was gone. When I listened VERY carefully to the transmit audio monitor, I could hear a VERY LOW hum when using this problem mic. You must listen carefully. I found a problem with the mic wiring. I fixed the wiring and the hum disappeared.

Some Hams do not even realise that they have a ground loop problem. They never even listen to the transmit audio (or even the receive audio) when using the digital modes. If they never listen CAREFULLY, they will never know unless someone tells them -- typically another local station.

For many digital modes, you can still be copied (but usually not as well) by another station if you have a ground loop problem. The DSP based filters used by most sound card programs typically filter out the hum.

The same thing typically happens when you use a mic with ground loop problems. Most Hams can still copy your audio but not as well. Sometimes only local stations can hear the hum in your mic's audio. e.g. I operated most of a contest with this problem mic and made lots of contacts. No one ever complained about the hum until a LOCAL station heard my signal. DX stations could not hear the hum even when I asked for a audio quality report!

I have not heard many stations complain about RFI problems when using a computer's sound card as the modem. This can be partly explained by the presence of RFI bypass capacitors INSIDE the VAST majority of rigs. In most cases, you really do not need RFI bypass capacitors and other RFI prevention measures inside a sound card interface device UNLESS you are using one of the FEW rigs that do not have RFI bypass capacitors inside.

Brian Beezley (k6sti) announced last night on 13972Khz his return to supporting RITTY. He has a new version out called 4.0 RITTY and is now available..

4.0 is completely new, and is quite an improvement over the older 3.0 version..

Brian can be reached at email k6sti@n2.net for copies and upgrades from 3.0...Glad to see him back, as that was the best decoding rtty software around...

Source record: 11690

Thanks for this info, I am probably going to build a WA4DSY 56kb radio modem, unless I can find a better design. Anyone know of what sort of range you can get? I need around about 50km. All stations will be withing a square surounding a digipeater, at a maximum of 25km away. They need to be able each others transmissions as it will be using an ethernet topology. However what I was thinking of is that if one station is in a hollow and can't see everyone's transmissions, the digipeater could act as relay. The digipeater would know that the station was there and could pick up certain people's transmissions, and automaticaly store and forward a transmission.

Then to get to another grid area, the station would send to the digipeater, which would then forward the packet to the next digipeater, which would send it out on the frequency of that grid square. Basically the digipeaters would run router software. Could this system work?

I run RITTY 2.x 3.x and 4.0 under Win95 and it works just fine.

All I did was make a directory for it, unpack the files into that
directory, then did the start menu thing where you browse for it
and make a link into the start menu and run it from there. When
I click on thes start menu item it takes over the screen and works.
For what that's worth...

> that's it ... you have a gateway!

Really? So what software, from 1984, allows me to setup a link that will tunnel TCP/IP trafic seamless through a radio link just as if it had been a DSL link? Oh and btw, even if I had a full fiber optic cable with routers and stuff, "set your ip address and that's it" - I think you need to read up on the IP protocol. You make it sound like the most expose to the protocol you have experienced is the automatic setup you get from PPP when you dial your local ISP.

1200 BPS wont even allow the normal protocols to work without modifications. 9600 half duplex is just as much a joke. Full duplex allows it to work in theory, but when did you last try to browse WWW at 9600 bps much less connect a full network through? ISDN speed of 64 Kbit can carry the trafic of one user provided he isn't running any considerable server stuff.

ISDN speed isn't fun but I will settle for that for now. Since I am clearly overlooking something, tell me what the trivial solution is to do that?

I can't use those part 15 microwave links everyone are boosting about, there is no line of sight. I want a solution that works on 70 cm because that band is almost unused in my area and it has been proven to be able to maintain a link between the locations in question at fairly low outputs.

> The only "ham radio" part is connecting the radio to the
> TNC and antenna. You can buy premade cables for this ...

I admit that my current plan is not to modify the radio much for now. So am I not the most hardcore HAM ever, I don't trust that I can really build my own 70 cm tranciver. Can you?

I will however build my own TNC and design my own protocol for it. So far my research has shown that the protocol used for both 1200 bps and 9600 are simplistic and there seems to be no reason I can't implement a modulation that uses the bandwidth far more efficient.

I consider that task to be much more "HAM spirit" than just going for a HF license and see if I can blow up more money on big antennas than the next guy in my attempts to create useless long CW connections (on my factory build 3k$ base station with the most challenging task of a new mode being reading about how to activate it in the manual). That has all been done before, where is the challenge?

There is also more than enough HAM activities in building a radio based network even if you use factory build equipment for all of it. The digital people are just as much into the tuning the antennas, exploring the best links possible given the limits set by the surrounding geography and buildings, communicating with other HAMs with simelar interrests etc. Thinking this is a "lesser" form of HAM activities than what you are doing is silly. The interresting parts are just different ones.

However, you can just keep that attitude. The result is obvious: The HF people with the attitude that UHF digital is not real HAM will get all the old retired people that just wants someone at the same age to chat with. In the mean time we will harvest the young people which will seed the ground for the future of HAM. As I said in my original mail, you will not succeed in scaring us away, you will only disconnect yourself from us so you have no change in turning some people over to play with HF also.

Baldur

KA9Q "NET" or any of it's follow-on variations.

There are other obvious ways to do this as well, see for example,
what the hams running Linux are doing. It's just not very hard.

Anyone upgraded lately and have an extra KPC3 6.0 firmware chip laying
around?

I'm in the market for a couple of them, but one will do.

Ten years ago we all thought it could. And technically it can. Especially
when you make sure it isn't all happening on a single frequency.

Your problems will not be technical, at least not when you build upon the
work that lots of others have done in this field.

When you don't have an infinite supply of money, that will be a problem.

My $US10 interface does that -- the PC is connected to the accessory
socket on the radio.

$80 may be a reasonable price given all of their costs, reasonable
profit, etc. However, any ham should be able to build his own.

Who do you mean then? All those homeless hams out there? It always gets me that hams will spend over $1,000 for a rig (or $2-3 thousand more than that for very incremental improvements offered by a fancier rig), ditto antennas, but then will pass up the digital modes due to a few hundred bucks required for a TNC or similar controller. Sure, $80 bucks is a lot of money to some people, but frankly, it isn't much compared to the amount of dough most active hams spend on the hobby. Noise level stuff.

I have a group of people interested in getting a network going for the sole purpose of sharing weather data live, and mobile. We also have potential funding, if we can show that it works. So because this network is being designed by a group of people who all want the same thing out of it, we may have a chance of succeeding.

I was only responding to your argument that the MFJ switch box and the
RigBlaster are very similar in complexity and therefore should cost
roughly the same. I contend that the RigBlaster is several times more
complex than the MFJ, and that if the MFJ is "worth" $40, then the
RigBlaster is easily "worth" $80 or more. I speak from 30 years of
experience in aerospace and commercial electronic manufacturing,
including cost estimating.

> Anybody have one?

It's unlikely that a 486 will do the job. You need brute CPU
power, which means a 486DX/66, minimum. At that, it will
be breathing pretty hard. Anything slower will not be viable.
Don't even think about a 486SX.

The software you seek may never have been written for Windows
3.1. If there's anything around, it will be in the usual
repositories, like simtel and cica.

An interesting thought is that despite the optocoupler for the PTT line
and the isolation transformer in the transmit audio line to the radio mic
input, the computer chassis is tied directly to a-c protective ground
through the "green" wire in its power cable, as is the radio. Thus, the
two chasses are connected despite the presence of the optocoupler and the
transformer. Some folks have had to resort to two-prong a-c adapters to
break up this common connection when operating PSK31 and other digital
modes involving the computer.

The situation is even more interesting when you consider a
computer-controlled radio like my Kachina. There the RS232 cable to the
radio runs a wire from computer chassis ground to radio chassis ground as
the common for computer/radio communications. Thus, there is yet another
conductor circumventing the optocoupler and transformer "isolation."

I don't know about you folks, but my interface consists of two shielded
audio cables from Radio Shack. No ground loops, no feedback, no hum. Lab
tests on the Kachina in PSK31 mode, with a separate station in the shack,
shows that the third-order IMD component is 35 to 38 db down. That is on
the air, not into a dummy.

Ha ha ha! Har! Giggle.

So far reported into this newsgroup is exactly ONE link using
Part 15 devices. It spans a whole 5 miles. If anyone has had
better luck than that, they have not reported it.

You doing better? Tell us about it.

If you cannot recall what we are doing here in this part of the USA,
a perusal of past posts to this newsgroup will enlighten you.
With that dedicated group with common interest, one can indeed
build a working network spanning hundreds of miles. No, it is
not cheap ... but it can be done, and it HAS been done. Part 15
devices are totally useless for this kind of network.

3234. Rigblaster with Yaesu FT-840 Help Needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-25 00:00:00 UTC
From: kt4ht@aol.com
Message-ID: <20000724225820.23349.00001189@ng-fi1.aol.com>
Source record: 11622

I have a Yaesu FT-840 that I am trying to use the Rigblaster with. Using Digipan, I have not been able to get the automatic keying to work. When I plug in both the serial cable and audio in from the computer to the Rigblaster, the automatic keying does not work. With the audio in disconnected, the automatic keying works fine, but of course, there is no transmit audio.

The jumpers are set as per the manual for Yaesu rigs and all michrophone functions work correctly. I can send PSK31 if I key the rig manually.

Any help would be appreciated.

I'm not familiar with part 15 devices what are they? Also would they allow a storm chaser to pull over 20km out of town, pull out their laptop and login?

3237. WinWarbler - a new PSK31 program

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-25 00:00:00 UTC
From: Dave Bernstein <dhb@rational.com>
Message-ID: <4J8f5.45357$DJ2.225359@typhoon.ne.mediaone.net>
Source record: 11625

WinWarbler allows you to conduct QSOs using the PSK31 mode developed by Peter Martinez, G3PLX. To aid PSK31 DXers, WinWarbler can simultaneously decode and display PSK transmissions on three separate frequencies. A PC running Windows 95, 98, 2000, or NT is required. WinWarbler is free, and contains no advertising. Commercial use is expressly forbidden.

WinWarbler utilizes the PSK engine developed by Moe Wheatley, AE4JY; by encapsulating his expertise in a reusable component, Moe has reduced the time required to develop a PSK31 application to a few days (including a couple of transatlantic flights). The WinWarbler installation package includes version 1.05 of Moe's PSKCore.DLL.

You can download WinWarbler 1.0 from http://www.qsl.net/winwarbler/ - consider this a beta release, as testing to date has been limited to a dozen QSOs; defect reports, comments, and suggestions will be gratefully accepted. WinWarbler's online help is provided in HTML, which you can evaluate at http://www.qsl.net/winwarbler/Help/ before downloading the entire package.

WinWarbler is written in Visual Basic; source code will be made available for non-commercial use at the completion of the beta period.

73,

Dave, AA6YQ

The WWW is a joke on society, it will never last.
The VT-100 interface is right up there next to God!

> ISDN speed of 64 Kbit can carry the trafic of one user
> provided he isn't running any considerable server stuff.

Hogwash. I had 5 users running 33k 24hr/7day links on a
64k link. It's what you do that counts. If you want to steal
music or files on Napster, etc, then yes, stealing takes a lot
of bandwidth. Rather than pay big bandwidth bucks to
steal, you could go with a 9600 baud modem, and go buy
the fricking CD.

Nope. Neither will 56k. You're talking very wide channels with no FEC.
Range without beams is very short. Use a TV station as an example.
Very high power, 6 MHz bandwidth. How far can you see the megawatt
station reliably? Not far enough...

5 miles is emergency communications around here. Makes a
great repeater link (data, video, and voice).

> No, it is not cheap ... but it can be done, and it HAS been done.
> Part 15 devices are totally useless for this kind of network.

I agree. BBS is a low baud affair. Higher speed is unjustified.

> "Part 15 devices: Very limited short range plug and pray."

Not very original, and not very true. Long range at high bit rates
is different than long range at low bit rates.

Either mode is purely pluggable, neither requires religious
devotion.

This is not a problem, this is "Innovation". You know, the thing that Bill
Gates thinks you will be deprived of when the government gets its way.

Those programs will probably run just fine in DOSEMU under Linux. Because
that is more like a real DOS box.
VMWARE running DOS under Linux or Windows NT will be even better. That
provides a virtual PC running DOS. You can run Windows 98 in another
virtual PC if you like.

When you want to run legacy DOS applications, you should not upgrade your
OS too often. Especially not when the supplier of the OS wants to bash
DOS out of this world.

The fact that you apparently are lucky and don't see the problem in your
own shack does not mean the problem does not exist!

It depends on details that are difficult to predict and prevent. You may
have big problems when you install a different antenna or upgrade your
computer.

I agree with that. Transformers somehow seem to have a bad name, but
a transformer that handles 5 kV between primary and secundary and has
very good audio characteristics can be found in any telephone modem.

These are mass-produced items costing very little.

Optocouplers are tricky devices that are not easy to use in demanding
applications (linearity, fast switching). Avoid them when you can use
other methods.

It looks like you do not understand what a ground loop is...

A ground loop is a circular connection of ground between two or more
points. In this situation: both transceiver and computer have their ground
connected to the safety ground of the mains, and their grounds are also
connected together via a signal cable.
Now you have a loop connecting three points. Any magnetic field spanned by
this loop will induce current in it, and this current my get converted into
voltage when there are some non-ideal connections involved.
This voltage is then added to the modulation signal (in this case).

Putting isolation transformers somewhere in this loop (can be in the signal
path, can be in the mains connection) you break the loop.
OF COURSE the two boxes are still connected (unless you have at least two
points of insulation), but the point is that no CURRENT can flow through
the loop anymore, and thus no voltage is introduced anymore.

>Some folks have had to resort to two-prong a-c adapters to
>break up this common connection when operating PSK31 and other digital
>modes involving the computer.

Those guys did not solve it in a safe and sound way.

>The situation is even more interesting when you consider a
>computer-controlled radio like my Kachina. There the RS232 cable to the
>radio runs a wire from computer chassis ground to radio chassis ground as
>the common for computer/radio communications. Thus, there is yet another
>conductor circumventing the optocoupler and transformer "isolation."

That is why controlling a radio using RS232 is not a very clever thing
to do. They should have at least isolated the RS232 interface from the
chassis (using optocouplers and a DC/DC converter), simpler would be to
use an interface that has isolation by design. Ethernet, optical fibre,
IRDA, you name it.

>I don't know about you folks, but my interface consists of two shielded
>audio cables from Radio Shack. No ground loops, no feedback, no hum.

You DO have ground loops, probably two, but you are not hit by them now.

Remember: the problem of a ground loop is that a current is introduced
by a magnetic field. This current will be small when there is little
magnetic field spanning the loop. This may be accomplished by making
the surface of the loop as small as possible (e.g. by tying cables together
that run to the same node in the loop. tywrap the RS232 and signal cables
between computer and rig togheter, tywrap the mains cables from rig and
computer together). Unfortunately this method is often in conflict with
another rule: try to keep cables from the computer as far away from other
cables to reduce noise and birdies.

Also, a small voltage introduced by the groundloop current will be more
harmful when the signal level of the wanted signal is low. That is why
it is a bad idea to connect a digital box to the MICROPHONE connector
of a transceiver. Microphone signals have a very low level, so there
is a lot of amplification behind that connector. Use a LINE-level input
and the problems will be much less or will even be absent. This is what
you may be doing with your Kachina.

But it is no guarantee. Look (in other newsgroups) at the number of
people attempting to connect their computer sound card to their HIFI
system these days. They of course have the same problems, especially
when the HIFI system is connected to an antenna or cable. They also
want the hum to be even less than amateurs would live with, so even with
LINE-level signals they need isolation.

True. However: I doubt you could build a rig of the same quality
for that $1,000. You may or may not be able to build an antenna
for the commercial price. (You probably could, because IMHO many
mass-produced commercial antennas are overpriced.) You can certainly
build yourself a PC-radio interface for less than $80 though, and
might learn something in the process.

What I don't understand is where this "ground loop" comes from. Why would it suddenly appear if I use a different antenna or upgrade my computer? My understanding of a "ground loop" is that it is caused by a difference of potential (60 Hz) between the computer ground and the rig ground and that causes current to flow in the shield of the audio cables. Where does this difference of potential come from if both the computer and the rig are properly grounded to the same electrical outlet? Any voltage drop would have to occur in the resistance of approx 12 feet of wire (6 feet of computer power cable plus 6 feet of rig power cable). Either the rig or the computer must have a fair amount of leakage to the chassis.

I'm not disputing that some people have ground loops or that the transformers help to minimize them. I wonder if the problem being so wide spread that everyone should automatically use transformer coupling and if so, why.

A single ground connection is fine (and probably desirable). The problem
is when you have multiple connections and ground loops are created.

True. But what is the chance that an audio transformer will go short
circuit between the primary and secondary? What is the chance that
the optocoupler will short between its primary and secondary? The
first risk is larger than the second, but I think they're both small.

I agree with you in principle but I think the law of diminishing
returns applies.

That is quite a lot of work. I investigated isolation for the CAT
control connection between my rig and the PC. I have a 4N25 in the PTT,
but nothing in the CAT control (which doesn't appear to be causing
any problems). Without biasing circuits you can't pass the bipolar
RS-232 signal through the optocoupler because it uses an LED and
photodiode.

This is often a problem when you have long cable runs, especially parallel with AC power runs, such as in commercial audio mic lines. These loops are not a problem unless an AC signal gets magnetically coupled into one of the lines. I wouldn't expect that to be the norm for a 6 foot or less audio cable between the computer and the rig - but maybe so. Even if it was, simply moving the cable should cause a change in the hum level. Maybe there's something to be said for not being so neat and tywrapping all your audio and power cables together :-)

Just a thought - I wonder if these currents could be getting magnetically coupled into the ground wire of the power cords by the magnetic field around the hot and neutral wires. That could account for major differences between computers/rigs, depending on the size, balance and makeup of the different power cables.

>each others transmissions as it will be using an ethernet topology.

Ethernet style CSMA will not work reliably with such distances and
high speeds. In order to work reliably, omnidirectional antennas would
have to be used and in order to get the required ERP, quite high
transmitter powers would be required. My guess is that the 56 kbit/s
receiver will require about -110 dBm of receiver power. Looking at
some old troposcatter diagrams (The Radio Amateur's VHF manual,
1972), the path loss for 50 km and 99 % reliability is about 160 - 170
dB. Thus, a transmitter power of +50 .. +60 dBm (100 W .. 1 kW) is
required.

If you are going to use a digipeating station at a central location,
why not make it a network control station (master) which passes an
access token to each end user (slave) station. By doing this, there is
no need for a station to hear all other stations in order to avoid
collisions. While the master station still would have to use
omnidirectional antennas, all end user stations could use directional
antennas both for Rx and Tx pointing at the central station, thus
reducing transmitter power considerably. Thus, with 25 km maximum
range and 15 dB antenna gain, the required transmitter power is down
to a few watts.

If the end user equipment can operate split frequency (as any HT in
repeater mode), then only a ordinary phone repeater (with possibly
widened IF filters) can be used as the central station and ordinary
CSMA can be used at the end user stations with no need for special
master/slave systems. Any signal regeneration would be lost, but
assuming that the uplink and downlink paths are sufficiently reliable,
it should not be needed.

No, I mostly meant young "Kid" hams, who generally have a computer long
before they get into radio. I've "Elmered" about 5 of them, and while
Mom and Dad will always spring for a computer, and usually an HT or
good, used HF rig, they may not go for a $90 accessory box.
Of course, I also strongly encourage building your own stuff when it's
that simple, and the parts are readily available. It's the best way of
learning, and a little project like this is a good place to start.
I don't have anything against RigBlaster...I think it's a nice product.
I was just commenting on the fact that not everybody can come up with
anotther $90 (plus shipping) to buy one.

No. This may be a problem as well, but that is not a ground loop.

The ground loop is a loop of wire through your shack.
It does not suddenly appear or disappear, but its adverse effects may.
Because it causes trouble only if current is induced in it by a magnetic
field, and if this current is converted to voltage by a resistor some
where it should not be. (ground connection in a connector, path between
connector and signal ground of input amplifier, etc)

Most hamradio equipment manufacturers are too cheap to include RS232
circuits in their transceivers: they provide the signal as TTL, and leave
the conversion to RS232 to an external interface sold as an optional extra.

Of course no real ham buys this interface (another $50 item that has only a
MAX232 in it!). When you build your own, you can include isolation in it,
and conveniently do it at the TTL side.

True. This must be the first disadvantage to having RS-232 straight
out of the radio though (as my FT-847 does).

From: kbtgw@spec.net
Message-ID: <8lmsq0$47i$1@ns3.specdata.com>
Source record: 11553

Hi, name here is Les.

I have a PCB-88 Packet board, cables, power supply, manuel and programs [3 1/2 and 5 1/4 floppys]. This will work both VHF/UHF and HF Packet.

Works with any IBM or compatible computer with an open slot.

Works even better with XPWin etc.

Asking $100 + shipping.

Reply via E-Mail only to kbtgw@spec.net only.

Hams can significantly increase the range of Part 15 devices by easily adding antennas and, with only slightly more difficulty, adding amplifiers. At up to 1 watt of power, these devices are capable of real communications over distance. The Part 15 antenna must be "integral" and not exceed 6 dBi. See CFR 15.247 (http://www.fcc.gov/mmb/asd/bickel/47CFRrule.html). Hams are not bound by the power limit or antenna gain of Part 15, but can use unlimited antenna gain and power as defined in Part 97.

Not sure if 1 W and a decent antenna would reliably do 50 kM over most paths, though. Any good path-loss analysts care to chime in?

Good luck getting Hank to listen, Ed.

I've got a feeling that Hank may live in an area where he would not be
able to make many contacts, even if modified part 15 devices DO catch
on. I've got three places that I stay at in Southern California. For
the short term, my best locale for this work is in an fairly urbanized
area - my parents' house in San Diego. That is why I'm constructing my
tower there. Unfortunately, due to a number of factors, I've had to
scale back my tower plans, and I'm now submitting a building permit for
a 29' tower. To appease my parents, their neighbors, and to stay under
a 30' city-imposed fee level(no fee if under 30' - $90 if over 30'),
I'm only going to be able use 3 sections from the hbx48 I bought.
However, I'm going to build the foundation, and select the lower
section in a way that I could add 16' more some day.

A guess: yes, 50 km is not unreasonable and longer paths
should be possible when done in the ham band with "true optical
line of sight paths" and not-too-large antennae. This means
point to point links, two ends required for each ham station
linked to the network.

Cost of something like this? Less than $1000 per end?

But 50 km is, in my view, "limited short range" ...
For urban or suburban use, in open areas, where the density of hams
is high and the density of obstructions is low, these devices might be
useful. Won't work here though, since the above conditions do not apply.

So how to build the longer haul network links to hook these fast
metro-area nets together?

From: Darrell Earnshaw <darrell@earnshaw.org>
Message-ID: <8lnen6bgd1@news1.wdf.sap-ag.de>
Source record: 11560

Hi All,

Forgive me for a slightly OT enquiry, but it is somewhat related to APRS.

I'm considering purchasing a weather station for home use, preferably one that also displays barometric pressure, possibly for APRS use in the long-term. For those of you running weather stations, I'd appreciate some guidance. Currently, I've been looking at:

Peet Bros Ultimeter 2000.

Davis Instruments Waether Monitor II

Oregon Scientific Weather Monitor.

On initial inspection, it looks like Oregon gives the most bang-for-the-buck, as it includes all the items which are 'optional' in the Peet Bros and Davis kits. It also has a cordless version for $499, which unfortunately operates at 433Mhz.

Does anyone have any experience with these models, advice, recommendations, etc? (Email copies of replies would be prefereable, unless anyone else wishes to read the feedback.)

Appreciate any help...

73, Darrell

I tried it. I like the two received signals feature, but I wish you would have retained some of the user friendly features of WinPSK. Those features make it easier to use. I hope you will consider adding them in future updates. I would also like to see an English help file and some user documentation. All in all, a good start.

You might try paKet 6.2, available at ftp.tapr.org in
/software_lib/terminal. It has features similar to many of the host
mode programs but works with the standard TNC command mode.

Source record: 11566

Take a look at:

Section (a)(3)(i) and (a)(3)(iii)

6 dBi for an Omni antenna, with 30 dBm maximum into it.
6 dBi for a beam, with 1 dB power reduction from 30 dBm for every 3 dB of gain.

Seems at odds with 15.203. But that statute states:

"...Further, this requirement [integral antenna] does not apply to
intentional radiators that must be professionally installed"

It doesn't define "Professionally Installed" but we can assume that they
mean an installation that meets the power constraints, and out of band
harmonic limits.

I seem to recall the old Bonneville Dam microwave towers were set 40 miles apart
and ran 1 Watt Klystrons into microwave dishes of considerable gain.
31 miles might be a bit much to expect.

Source record: 11567

Microsats. Lots of them. One a year. Spread Spectrum (DS).

While the Phase III should be considered an honorable mention, the
fact that it is 16 tons means it will probably never fly. The money
spent hauling this 16 tons all over the world and back down to the
French military base in South America, could have launched at
least *dozens* of these microsats. If phase III flies, it will be about
as potent as stuff we had back in 1990.

3278. How about this?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-26 00:00:00 UTC
From: David Findlay <nedz@bigpond.com>
Message-ID: <8lm29l$890$1@news.eisa.net.au>
Source record: 11569

How about this idea: You have a digipeater in the middle of your desired area of coverage, with an non-directional antenna. Each station that wants to use it has a low power narrow beam transmitter and reciever antenna aimed at the digipeater. When station A transmits a packet to the digipeater, the digipeater stores it, then sends it out on another frequency, which all stations are listening to. If the packet is for a station off another digipeater, the digipeater would send it on a dedicated link to the next digipeater. Mobile stations would just have to keep their antenna pointed at the nearest digipeater, or use a non-directional anntenna. Please feel free to tell me why this idea doesn't work.

David Findlay

P.S. The digipeaters would all be on hills.

Could a single frequency be used? What about full duplex operations? I am studying for a Cisco Certified Network Associate ticket and from that I have learnt that token passing systems are often slow. I think I will just have to experiment until I get a good solution and then just try to see what works. Looking at a map I may not even need 50km. I still don't know how to work mobile unless just having lots of digipeaters.

wrote:

>Could a single frequency be used?

Yes, that would be traditional digipeating. The problem is that you
have to receive the full frame before it is retransmitted. Also the
reply/acknowledge signal will suffer from this delay. If multiple
digipeaters are used to relay the message and end to end acknowledge
is used, the latency times becomes so huge, that the system is more or
less useless.

Remember also that in AX.25, the maximum data size is about 250 bytes
and at 56 kbit/s, the frame transmission times are below 50 ms, so a
very fast Rx/Tx turn around time is required.

>What about full duplex operations?

Full duplex is in principle only point to point, but if multiple
stations are required, the simplest solution is to use one master
stations with opposite frequencies, while the slaves communicate one
at the time with the master in full duplex.

Note that full duplex operation on a single amateur band will require
duplexers on all stations or the receive and transmit antennas must be
kept very far away from each other. Using different amateur bands for
the uplink and downlink simplifies the system, but some frequency
planning is required to avoid harmonics.

The use of a half duplex (phone) repeater is simpler, since only this
station has to operate in full duplex and require a duplexer if both
frequencies are on the same amateur band. The slave stations needs to
be able to receive on one frequency and transmit on an other, but not
at the same time, so no duplexer is required.

>I still don't know how to work mobile unless just having lots of digipeaters.

With normal AX.25 you are going to have a lot of "hidden transmitter"
problem, so the CS (Carrier Sense) part of CSMA will not work
reliably. You need some other mechanism to control when the mobiles
are allowed to transmit.

Note also that most amateur 1200, 9600 and 56 kbit/s are based of
narrow band modulation. These suffer from multipath (selective fading)
cancelling certain frequencies. When the vehicle is moving, the
frequencies that are notched out varies constantly and the narrow band
data stream fades to noise quite frequently or at least cause severe

phase shifts, corrupting the data. For reliable communication with mobiles some modulation method with a large bandwidth (such as spread spectrum, TDMA or COFDM) and strong FEC may be required, so that the multipath notch will take out only part of the signal and the missing part can be reconstructed from the ECC bits.

If you can guarantee that the mobiles are constantly moving, even narrow band modes may be useful at least above 1 GHz, since the multipath will take out the whole signal tens or hundreds of times each second, so with sufficient interleaving and ECC, the burst errors may be converted to random errors and reconstructed using the ECC. However, if the mobile stops due to a traffic jam or traffic light, it most probably will stop at a signal null and no communication is possible, until the mobile moves some centimeters :-).

>work with the THD-7A for 2 meter packet?

You could have a look at WinPack. It has full support for the TH-D7. See
my sig for the download site. When you install it, you'll find a file in
the DOCS folder called TH-D7.TXT, that contains information on how to
configure WinPack for use with the TH-D7.

Also, the TH-D7's with the latest firmware support KISS (older ones
didn't), and there's a huge amount of existing software that supports
KISS mode.

I just put in a Peet Brothers weather station and it works fine. The
main reason I picked it was because I'm a programmer, and the programming
interface of the Peet Brothers boxes are super-simple, and no hassle. I cooked
up a little program for my website

http://berkeleybarb.com

And, if you click on the weather button you'll see temperature and wind direction, among
other things. Right now I'm keeping weather stats on my hard drive, but I haven't done any
charts or anything like that with them. I'm really busy with work right now.

My program is in Linux and just reads the serial port, decodes the weather data, and
makes up a picture to display that has the temp humidity and other things. Then copies
the file into the web directory. (Which isn't really 'the right' way to do it, but seems to
work okay anyway.)

I opted for the 'radiation shielded' temperature/humidity sensor, since I really wanted
good
temperature readings, and was a little paranoid about placement of the temp sensor in the
sun or

near walls and other things. I got the non-heated wind gauge -- since here in Berkeley California
it almost never ever gets below 40F. I suspect that my wind speed and direction measurements
are a little bit innacurate due to turbulance caused by my antennas nearby. But, the thing seems to put out reasonable readings, and it's kind of fun to look and see what the fastest wind was, when it really blows. So far, I haven't hooked this up to any APRS stuff.

Me, I prefer the wired versions of everythings, since I didn't want to spend the money, and jeez, I got a billion antenna wires and things coming out of my house anyway. Two more won't matter, I figure.

For mounting, I picked up a 10 foot Radio Shack mast, and stuck it on and old chimney mount that I had used for antennas awhile back.

Do the Alinco TNCs share the bug present in the Kenwood TNCs - which is
the failure to acknowledge frames unless the Poll bit is set?

The Kenwood TNCs seem to have no ack timer, and simply do not acknowledge
frames without the Poll bit set. What usually happens, is the the 'other end'
times-out waiting and issues a RR with the Poll bit set, which elicits an
ack from the Kenwood.

This doesn't happen when using one Kenwood to connect to another, as it
always sets the Poll bit and always receives an ack immediately.

It really kills the effective throughput when connecting to most any
other station. Kenwood seems to have ignored my letter written in
May, complete with a packet trace of the problem.

I think Rob is right. There are some very basic things that you are
trying to discuss that are in books on packet. You also need to learn
a few things about radio in general - you don't seem to understand
receiver desense, intermod, or cross-band operation, just to name a few.

Scary thought! Use of such a high bandwidth medium for such a low bandwidth communication (which due to it's rare transport over such medium isn't even efficiently multiplexed).

It's more efficient to simply send the text, and have the remote machine TRANSLATE it to morse code.

It IS funny, isn't it?!

> It's more efficient to simply send the text, and have the remote machine
> TRANSLATE it to morse code.

Yes, I agree - but remember this is for pratice purposes.

I hooked up a microphone to my computer, and I went to some Yahoo Chat rooms. I am surprised at how well it works - I dont' see much delay.

Using chat, I suppose all I need is one of those Morse beeping boxes. I suppose until I get that, I could just simulate it will my voice!!

Actually, there is no math involved, and books won't help.
You need to purchase the nodes and interface cards, and set up
the computers to run the software you design.

I'm building a PAD-207 TNC kit but having trouble getting it going does anyone know of a site that would have a BIN file of the EPROM software. The E-PROM is only marked TNC +. The source of the kit is unknown and i have had it for about 18 months now.

Thanks for you help.

Just passed my Extra examination, and I'm left with kind of a empty feeling. Even though I won't be using CW any time soon, I think it would have been better if I HAD had to pass a 10, 13, or even 15wpm test in addition to the written exam(forget 20wpm!).

If there hadn't have been such ruthless opposition to the lowering of the requirements at some earlier date, to some reasonable numbers(say 5/10/15 N/G/E), I doubt if we would have seen this "rubber-band" effect of having 5wpm Extras.

Oh well, now I can devote more time to my applications, like the towers I'm building, and the high-speed wireless Internet gateways I want to set up. I even decided to finally join the ARRL. I'll probably even buy a new ARRL handbook(my 1994 version is getting a bit old).

For me, restructuring has been a pretty good thing. It got me back into the hobby(which I had distanced myself from back in 1995, when it appeared to me to be firmly stuck in the past). However, I think it just went a bit too far. The ARRL's recommendation of 13wpm(or was it 10 or 12?) for Extras was pretty much right on. It just came so late, that they had lost all credibility by then. What a shame.

Congratulations. There is something to be said for passing the written
exam! And yes I agree about the code, but if you are not going to use it,
then what the heck. I personally love cw and prefer it over voice, but
whatever works to assure the health of the hobby.

Take it on as your challenge to become a technical expert in the advanced
areas of radio, learn and share the knowledge -- that builds credibility!

Congrats on passing the exam and best wishes!!

There's plenty of certificates out there to replace the one from
the Federal Government.

When you learn CW at 35 WPM, or even the POW tap code
at 15 WPM, you will find a diploma with gold stars to be had.

Congrats to you and enjoy the new privleges!
I'm happy to see 'no-code' extras (aka extra-lites!). It will keep the crowds out of the extra CW sub-bands here in the US! More room for us 'coded' extras to operate. I see ours as a dying breed, which will make me a much need operator for contest and dxpeditions, hell we're already in demand!
For those who say eventually there will be no code sub-bands... well that's OK... by then I'll be a SK or perhaps have gone pure digital. I do hope to live long enough to hear the digital mode ops laughing at the obsolete SSB ops asking why they still use their mouths (HI).
Hey Stew, come on down to the lower 25 sometime... we'll be glad to 'talk' to you!

I was copying the mail on the way home about someone who got into PSK-31 and how well it worked.

With LW becoming more popular and with the expected LW US Amateur allocation somewhere in the FAR distance future. With narrow, slow and other limitations of LW, would this be a good mode to try out on the 1750 no license band?

hello has all,

I am testing the operation of the tnc3 and I have really evil has to
have the clear idees. With the diskette of origin and after having
to erase the memory flashes I included/understood well how to use the
file apl and scr by copying them in RAM, but I do not have reussi has
to make them function in flash. I seized badly has what serves the
abs file.... Is it as I think it the bios? And why I find ap files
and apl in RAM after the operation of flash, since I am sense to have
libere this site
Well on does that become complicated when I think has to install
Xnet, how to take to me there?

I think of copying the apl, net (to publish for my needs), xts in
RAM,I believe that it is all and then I put them in memory flash
(flash -ae * apl... etc) but after must I modify the abs origin,
in my two tnc3 there are flashes 29c5001 the operation of the switch
is made how owing to the fact that there are not a scr or dipX.apl
I will need to connect my two tnc with a cord null modem.

thank you for your comments 73' Tony

Stuart, I took the Extra exam in 1954. Had to copy 20 wpm for at least a minute solid copy and send enough to convince the FCC Examiner that I knew the code. Took the written, which at that time was composed of 50 of the most often missed questions on the commercial license exam elements. I passed all that and got one of the first 10 Extras issued in the Dallas district.

So, I go into the FCC data base as "AE"

Now, you took your code and written tests and passed them.

You go into the FCC data base as "AE"

What's the difference and who cares!

Operate and have fun and use that extra theory study to learn even more for the enhanced enjoyment of the hobby. Nothing says that you cannot continue to practice and operate and build up your code speed.

I started as a ham at age 16 on 20 meter CW back when newcomers were not cut very much slack. But, I got on there with all the big boys and their Vibroplexes with my little straight key and had a ball. In three months I was running 35 wpm with *my* bug!

Welcome!

Stewart,
And having to pass a high-speed code test for your Extra would have made
you a more technical, competent, more capable ham by ....??? Don't
have a guilt complex. You passed the test and earned your Extra, just
as I and others did in the past when the written requirements were very
different. (100 questions, draw schematics, etc....) It's a different
era, and the test process is appropriate to this era. As you mention,
this change got you back into ham radio. That can only be a positive.
So, continue your learning now that you have an Extra....get involved

with digital modulation modes, satellites..etc. But don't let the "code forever" OF's here on this NG make you feel like less of an Extra. Besides, those old curmudgeons won't be around forever. :)

Digital radio certainly DOES include voice modes, Dennis. I expect that most hams will continue to choose voice modes as their primary ham communication.

> Hey Stew, come on down to the lower 25 sometime... we'll be glad to

Careful, Dennis; it is perfectly legal, albeit not considered gentlemanly, to transmit digital signals on the lower 25 as long as they are data and not voice. Stew might give you exactly what you asked for.

Hey, I'm a code-forever OF, but I believe in code forever for Ed Hare; what others do within Amateur Radio, as long as it it within the constraints of Part 97, is fine by me. After all, if EVERYBODY showed up on 20 CW at the same time, my little QRP rig would be lost in the din. I, for one, appreciate the diversity within our ranks.

Stewart, I'm going to take you at your word that you truly feel this way. In my opinion, you're putting way too much emphasis on the test. Its just an entrance test, not a measure of your skill or knowledge. Its what you do after you pass the test, and get the license, that really matters. Think about all the new possibilities, and privileges, now available to you. Do something with those new privileges, and I'm sure you'll feel a lot better.

That's true. All testing is "dumbing down" as it is called. In schools
and in professional exams, so I suppose there is no reason amateur
radio should be exempt from the social change.

>As you mention,
>this change got you back into ham radio. That can only be a positive.
>So, continue your learning now that you have an Extra....get involved
>with digital modulation modes, satellites..etc. But don't let the "code
>forever" OF's here on this NG make you feel like less of an Extra.
>Besides, those old curmudgeons won't be around forever. :)

Actually the thing most people seem to dislike is the fact the
technical tests are getting easier along with the code. If the people
who had the FCC's ear were really interested in amateur radio, they
would have made an entry level license available for digital modes or
general voice and restricted CW on HF, like a low-code tech exam with
expanded privleges and a bit less theory.

Instead, the motive was to sell radios and other goods. That meant an
automatic upgrade was the best means to the end goal.

What I dislike about the restructing is they actually made getting
into the hobby no better....they actually made it worse. The main
function seems to be lowering the bar for all classes of license, and
lowering it the most for the highest classes.

I understand that from Kenwood's view. They are teetering on the edge,
and wanted to sell radios to stay in business. They tried to sell
radios at truckstops, but the hams stopped that so they needed another
way to spur sales.

It makes sense for W5YI, because he has long been for a
communicator-type of license. He also makes his money when people test
and study.

The problem is it doesn't make sense for our hobby, because we made
getting in no better...or actually worse. In the United States, the
number one priority is making all people equal...regardless or effort
or ability.

Probably not. PSK31 is not great with static crashes etc. You may want to try one of the newer modes like SLOWFELD, THROB or MFSK16 (if they are allowed on 1750).

And if we take him at his word that he really does wish that he had passed a 10, 13 or 15 wpm test, he is certainly free to increase his code speed to 15 wpm, or beyond, if he likes. I am sure we can look back later and see if he really meant what he said by seeing if he increases his code speed to 10, 13 or 15 wpm.

The bottom line is that most of us are not bound by the limitations that existed in the tests we took to enter ham radio. The old timers, some of whom took a test that I would judge to be harder than the ones I took, are free to learn modern radio technology that was not found on the exams of 1932. The hams of my era are free to learn more than was on the 16-page study guide we studied to get all amateur priveleges in 1963. Newer hams are free to learn more than is found in the 1000-odd questions in the pools and are free to learn anything that they feel should be on the tests.

I wish Stew well in what he chooses to do within amateur radio. He has clearly indicated an interest in digital communicaitons, a real "development opportunity" for ham radio. If, as he just stated, is also interested in CW communications, I am sure he will succeed at that, too, and will find many a willing Elmer to help bring him along.

There is another ham who is interested in passing the 5wpm test, and it dawned on me that it would be more interesting to make actual contacts via Morse Code over the Internet, than only following a practice course.

Due to the herky-jerky nature of TCP/IP, each sender's transmission would have to be buffered, but it should work pretty good. I would assume there would just be some small delay in the handshake(a few seconds at most - kind of what you get when you play a video over the Internet).

I did a quick perusal of the available Morse Code programs out there, and couldn't come across anything that did this. Anyone out there know of anything like this?

I suppose one who to accomplish this would be to use an on-line voice chat group, and just feed thru the audio tones. I haven't used these on-line voice chat groups - so I don't know how feasible this would be.

They won't because they will be on different frequencies. Also I was emailing the guy who designed the modem and he reckons that there has been a network in Atlanta using this same system for 5 years.

I'm starting to think that I am wasting my time asking question here. I would probably be better off doing the maths myself and reading books.

My feeling is that Amateur Radio and the CW mode would be better served by eliminating the code exams entirely. Then those who actually want to learn the code will do so of their own volition.

5, 10, 13 and perhaps even 15 wpm garrantees failure for majority of candidates, along with unecessary frustration and anguish. The intial target speed SHOULD be at least 18 wpm.

At 18 to 22 wpm the overwhelming majority of candidates will pass easily. No fuss, no drama, no angst.

Challenge: Obtain a copy of David Nye's (KB9PSL) Freeware Morse Code Trainer (abt 35 kB DOS) and start from scratch at 22 wpm. 3 to 4 weeks of half an hour a day, seven days a week WILL have you copying 22 WPM.

It is that easy.

73, Cynicus.

Exactly right. There are many things the Internet can do, but
there are also many things it can't do. Posting questions is no
substitute for in-depth background.

If people are really serious about communications and stuff, I
routinely recommend Communication Systems by Haykin, and Digital
Modulation and Coding by Wilson as places to start.

Ed, I think you are putting the bar way too low.

As a kid in high school, I found it easy to get to 25 wpm, and not all that
hard to get to 35 wpm. If ya wanna do it, ya spend the time and learn it.
Running liason between traffic nets will get that speed right up there ...
... as will trying to win sweepstakes ...

Randy--

You may have already solved your problem by now.

But some of mine get shelved for weeks/months, so here goes:

If you have fed the Tripmate its output back into its input
so it sees its own "ASTRAL" string, it should initialize itself
and start spitting out NMEA sentences.

Try using a simple comm program like Procomm, HyperTerminal,
etc. and see if you can view how it is behaving. If it is
initializing, then the problem must be in the D700a or the
interface.

Also, some D7a's had this firmware situation:
http://www.qsl.net/n6qab/kensb.htm

I don't follow the D700a since I don't own one (yet) :).

Just a thought.

You've got an idea there. I wonder if modems could have
intercommunicated with CW. Isn't the sound you hear
from your modem actually some form of FSK? Data?
Or is it closer in lineage to packet?

Message-ID: <OjDg5.38851$qS3.79598@tor-nn1.netcom.ca>
Source record: 11521

G3VFP is now selling a both a kit and a completely assembled sound card interface USING OPTO ISOLATORS THROUGHOUT (unlike RigBlaster which does NOT use opto isolators on the audio lines). G3VFP's unit isolates BOTH the receive and transmit audio lines (unlike RigBlaster which only isolates the Tx line).

There is even a schematic diagram of the circuit for those who want to build their own. See his web page -- http://www.users.myisp.co.uk/~vfp/kits.htm

The assembled unit costs around 23 pounds (or 50 dollars or so).

He even sells an assembled unit the isolates the RS-232 line for rig control.

What did I say?? Someone would sell a less expensive unit for around $50 that provides better isolation than RigBlaster!

3334. Re: psk31 and vox

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-29 00:00:00 UTC
From: Rob <Pse@NoEmail.Com>
Message-ID: <zmDg5.38855$qS3.79440@tor-nn1.netcom.ca>
Source record: 11522

It is much better to use an opto isolator to key the PTT line.
(for such a circuit, see www.qsl.net/wm2u)

If you use a transistor, you will defeat the purpose of using audio
isolation transformers on the audio lines to and from the sound card.

I guess there must be a reason why this post is on the digital
newsgroup. I'm too dense to see it.

3337. make big $

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-29 00:00:00 UTC
From: cjmcmillan1@juno.COM
Message-ID: <20000729.133550.-87595933.17.cjmcmillan1@juno.com>
Source record: 11525

Cash4Surfing

I found this on a bulletin board and decided to try it. A little while back,I was browsing through newsgroups, just like you are now, and came across an
article similar to this that said you could make thousands of dollars within
weeks with only an initial investment of $6.00! So I thought, "Yeah right,
this must be a scam", but like most of us, I was curious, so I kept reading.
Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups.
(There are thousands) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured,

"What
have I got to lose except 6 stamps and $6.00, right? "Then I invested the
measly $6.00. Well GUESS WHAT!?...Within 7 days, I started getting money

in the mail! I was shocked! I figured it would end soon, but the money just
kept coming in. In my first week, I made about $25.00. By the end of the

second week, I had made a total of over $1000.00! In the third week, I had
over $10,000.00 and it's still growing. This is now my fourth week, I have
made a total of just over $42,000.00, and it's still coming in rapidly.
Let me tell you how this works and most importantly, WHY it works.
Also, make sure you print a copy of this article NOW, so you can get the

information off of it as you need it. I promise you that if you follow the
directions exactly, that you will start making more money than you thought
possible by doing something so easy! Suggestion: Read this entire message

carefully! (Print it out or download it.) Follow the simple directions and
watch the money come in! It's easy. It's legal. And, your investment is only $6.00 (plus postage)

IMPORTANT: This is not a rip-off, it is not indecent,
it is not illegal, and it is 99% no risk - it really works! If all of the
following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE: please follow these directions EXACTLY, and
$50,000.00 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You
will
now become part of the Mail Order business. In this business, your product
is
not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to for quality
lists.
However, the money made from the Mailing lists is secondary to the income
which
is made from People like you and me asking to
be included in that list. Here are the 3 easy steps to success:

STEP 1: Get 6 separate pieces of paper and write your name and address plus the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING

LIST."
Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent (thievery).
Next, place one paper in each of the envelopes and seal them. You should

now have 6 sealed envelopes, each with a piece of paper stating the above
phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all.
So
I
checked it out with the U.S. Post Office 1-800-725-2161) and they confirmed that it is indeed legal.

Mail the 6 envelopes to the following address:

1. Julius Tausaga, 2006 A.Fern St. Honolulu, Hawaii 96826
2. Steve Dixon PO box 511 Fairview NC 28730
3. Dan Polzin 7409 Wallingford St. Louis Mo 63121
4. Richard East 356 Grove Ln, Murray, Kentucky 42071
5. Jack Dukeshire 2 Army St, Randolph, MA, 02368
6. Bradley McMillan, RR#4, Winchester, ON, Canada, 12541

STEP 2: Now take the #1 name off the list that you see above, move The other names up (6 becomes 5, 5 becomes 4, etc.) and Add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups) All you need is 200, but remember, the more you post, the more money YOU make! You won't get very much unless you post like crazy. This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of

integrity, the program will continue and the money that so many others have received will come your way. NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.) So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be

receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now,
add
your own name to the list and you're in business!

---DIRECTIONS----FOR HOW TO POST TO NEWSGROUPS---------
Step 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter, drag your
cursor to the bottom of this document, and select 'copy' from the edit menu.
This will copy the entire letter into the computer's memory.
Step 2) Open a blank 'notepad' file and place your cursor at the top of the
blank page. From the 'edit' menu select 'paste'. This will paste a copy of
the letter into notepad so that you can add your name to the list.
Step 3) Save your new notepad file as a .txt file. If you want to do your
postings in different settings, you'll always have this file to go back to.
Step 4) Use Netscape or Internet explorer and try searching For various newsgroups (on-line forums, message boards, chat sites, discussions.)
Step 5) Visit these message boards and post this article as a new message
by
highlighting the text of this letter and selecting paste from the edit menu.
Fill in the Subject, which will be the header that everyone sees as they

Scroll through the list of postings, in a particular group. Click the post
message button. You're done with your first one!
Congratulations. THAT'S IT! All you have to do is Jump to different newsgroups and post away. After you get the hang of it, it will take about
30 seconds for each newsgroup! (There is a faster way. You may use Microsoft
Outlook or Outlook Express to select newsgroups rapidly. You just need one
time "Copy and Paste" to send to all of them simultaneously.)
**REMEMBER,
THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT: YOU HAVE
TO POST A MINIMUM OF 200** That's it! You will Begin receiving money from
around the world within days! You may eventually want to rent a P.O. Box

due
to the large amount of mail you will receive. If you wish to stay
anonymous,
you can invent a name to use, as long as the postman will deliver it.
**JUST
MAKE SURE ALL THE ADDRESSES ARE CORRECT. **Now, each of the 5 persons
who
just sent me $1.00 make the MINIMUM 200 postings, each with my name at
#5
and only 5 persons respond to each of the original 5, that is another
$25.00
for me, now those 25 each make 200 MINIMUM posts with my name at #4 and
only
5 replies each, I will bring in an additional $125.00! Now, those 125
persons turn around and post the MINIMUM 200 with my name at #3 and
only

receive 5 replies each, I will make an additional $625.00! OK, now here
is
the fun part, each of those 625 persons post a MINIMUM 200 letters with
my
name at #2 and they each only receive 5 replies, that just made me
$3,125.00!!!Those 3,125 persons will all deliver this message to 200
newsgroups with my name at #1 and if still 5 persons per 200 newsgroups
react I will receive $15,625.00! With an original investment of only
$6.00!
AMAZING! When your name is no longer on the list, you just take the
latest
postings in the newsgroups, and send out another $6.00 to names on the
list,
putting your name at number 6 again. And start posting again. The thing
to
remember is: do you realize that thousands of people all over the world
are
joining the Internet and reading these articles everyday? JUST LIKE YOU
are
now! So, can you afford $6.00 and see if it really works? I think so...
People have said, "What if the plan is played out and no one sends you
the
money? So what! What are the chances of that happening when there are
tons
of new honest users and new honest people who are joining the internet
and
newsgroups everyday and are willing to give it a try? Estimates are at
20,000 to 50,000 new users, everyday, with thousands of those joining
the
actual Internet. REMEMBER, play FAIRLY and HONESTLY and this will
really

work. The possibilities can be endless...You will never know, unless
you

give it a try... otherwise, it will always be "what if."
GOOD LUCK!

YOU'RE PAYING TOO MUCH FOR THE INTERNET!
Juno now offers FREE Internet Access!

I thought all the versions of PK232 firmware supported packet. Your PK-232 should already do packet. Give it a try!!

I suspect that you are really referring to Pactor not packet. Yes, you will likely need the latest firmware from Timewave for Pactor.

I have heard that the PK-232 firmware from Timewave works well in Pactor. (But I can't tell you from first hand experience since I do not have a PK-232).

By the way, there is a lot of Pactor 1 activity on HF. Many Hams still use Pactor to access BBS's on HF (though some Ham's have upgraded to Pactor II by buying the PTC II or PTC IIe from SCS). You cannot upgrade the PK-232 to Pactor II.

Believe it or not, the Hayes 1200B modems came with morse code ability. Look in one of the appendices. I think one could take the modem "off-hook" by issuing ATH2, which put the modem in "transmit mode" (and shorted the second pair of wires together), and then periods and dashes sent to it came out as code. At the end of the transmission, one had to issue a special command to keep it "off-hook" but otherwise disconnect it (i.e. "receive mode"). Too bad that it didn't actually receive the code too.

3347. PSK31 message relay test

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-07-30 00:00:00 UTC
From: kf4sir@earthlink.net
Message-ID: <39843bf6.9733915@news.earthlink.net>
Source record: 11535

Hi all, Dale KF4SIR will be testing sending messages using PSK31.

The first test of using PSK31 to relay e-mail messages will run on
August 12, 00 starting at: 12:00Z and running to 14:00Z using the
normal BPSK mode then from 14:00Z to 15:00Z using the QPSK mode.
Weather permitting (I live in thunder storm alley) - I will try and
run a second session August 13 (UTC) from 00:00Z to 01:00Z using QPSK
mode then from 01:00Z to 03:00Z using BPSK.

Should be interesting to see how the QPSK mode does.

In a effort to prevent QRM on the normal QSO frequency, will be
running contest style auto CQ on 14.090Mz + 1500Hz or so. Look down
if frequency is busy.

Will only be testing the outbound relay leg at this time. So please
stop by if you can, you will just have to copy one short message then
be on your way.

For more information please see:
http://psk31relay.net

Thanks, Dale

I don't think it should be any made any harder to get into Amateur Radio.
If we make it any harder, before long there won't be any new hams, and Ham
radio will be dead.
As far as I'm concerned, you could get rid of the code requirement
altogether. I still think code is very usefull and fun, but it is going to
die out eventually. Especially with modes like PSK now in use.

The eeeeennnnnnnddddddless code-no code debate.

The purpose of ham radio is not to grow and have fun and stay alive. The purpose is for the nation to have a trained set of knowledgable radio enthusiasts that could be drawn upon in case of national emergency.

It could be that the nature of the trained enthusiasts needed no longer makes sense in the modern world. Current commercial and military application of radio is quite technical and complex. Perhaps the hobby should change to keep pace with it --- or maybe it should die.

Hi David,

The "tigertronics BAYPAC things" work just great for packet. If even used it on an old 8088 laptop, floppy drive only with DOS packet software. You can't beat it for size and that it requires no additional power supply. Just plug it into your serial port. They even work great with the right windows software, despite what Tigertronics says on their web site. I used one for over a year running Winpack. There is lots of info on making it work on internet.

I have the Tigertronics BP-2M multi-mode unit. I never had much success on HF using Hamcom, the most recommended program. I almost gave up on HF modes until I found a "freeware" program called Intercom by PA3BYZ, which works very well for CW, RTTY, ASCII, SITOR FEC, FELDHELL, (RX only) SITOR, ARQ & PSK. (http://ourworld.compuserve.com/homepages/pa3byz/rttymade.htm)

Respectfully, I think you're missing the point. It's all well and good that you had to walk through the snow to school every day, 2 miles, uphill, years ago. But today, there's a faster route to that school where we don't have to go uphill and the snow plows keep the roads clear. Should we keep taking your route anyway?

Morse used to be the only way radio op's could communicate. Working at 25-35+ wpm was a legitimate skill every radio op needed to have. However, in 2000, it has become fairly obsolete. Even the Coast Guard quit listening for it years ago. I hate to say it, but it seems little more than an enjoyable, challenging, ham pasttime any more. Who else besides us is using it?

A viable means of communication? Definitely. A good thing to learn? Probably. It shows dedication to the hobby and weeds out casual candidates who would otherwise turn ham radio into CB. A necessity for radio operation? Not any more. Should it be included on the test? Probably not. How does Morse code advance the radio art these days?

It depends on what you need. A real TNC, or a MODEM that can be used
to do packet while connected to a PC RS232 interface. The latter can be
considerably simpler, as it does not need to contain a CPU etc.

I think this is but a pipe dream. But perhaps I am being unnecessarily pessimistic (given that I work in related fields). Perhaps you can expand on what you mean. What can an Amateur Radio Operator (ARO) do that could not be done by a trained emergency organisation operator? Unless that ARO is current with the emergency network's protocols, is that ARO a help or hindrance?

> It could be that the nature of the trained enthusiasts needed no longer

Being both a professional in radio and an Amateur, I don't have such a Black & White view of the radio world. Hobby activities have a much broader function that providing a pool of people trained to professional level in that activity - usually, they don't. IMHO, the main advantage of a hobby activity is to provide a wider community appreciation of that area of activity. In a democracy, it is more essential that people (voters) appreciate an activity than understand it in minute detail. AR is a means of providing that appreciation.

Mark.

I think you missed my point.
It was simply that proficiency in morse code is not very difficult.
I didn't say anyone *should* or *must* learn it.
Note the qualifying "If" in the second sentence.

Kantronics KPC-3 is fairly small, low power. Some folks have
modified them to hold an internal nicad.

Heath HK-21 or Telereader uTNC-21 is size of cigaretter pack,
has built in battery, is a TNC2 clone. Nice for portable operation.

I have a uTNC-21, don't really need it, would sell for reasonable price.

Hi!

Don't know if I've got the right newsgroup for this, but here goes.

I've got a 1998 Dodge Grand Caravan, and am trying to find an existing route through the firewall to run 12 volt power to a amateur mobile transceiver installed in the vehicle.

Is there anyone out there that's done this, either for amateur or land mobile gear?

Thanks!
KJ7FD

Be there. Trained emergency operators aren't always there, but there's lots
of Hams.

Check out the ARRL continuing education program. Lots of info about
emergency communications there, for those of us who are not familiar with
the basics.

Hi all,

I need install a Baycom modem on my PowerBook 145B.
My Baycom is in PC DB9 Serial port.
Anyone can send a pinout converting DB9 to DIN 8 (Mac miniDin).

Can I run the SoftKiss (Baycom soft packet) in my old PowerBook 145B?

Thanks for attention.

I felt the same when I passed my general written, what I am going to do is
have a HAM friend give the 13wpm now and my 20 wpm when I take my extra.
They won't do anything for me as far as the exam goes or give me anymore
privileges, but at least I will know that I passed them. Just a thought.
Good luck and 73

I'm not saying that they could or are trained to do what commercial
operators do day-to-day, but to be available to perform those
communications duties if needed. The purpose is to provide a trained pool
of radio-knowledgable citizens.

Work for free!

Our local group can and shas provided a couple dozen trained peope to work
as weather spotters, and both support and communications durring emergencies
with chemical spills.

> Unless that ARO is current with the emergency network's protocols, is
> that ARO a help or hindrance?

We are trained and receive picture ID cards that give up access directly to
the EOC. <:-))

We provide primary communications (related to weather) during weather
emergencies and secondary, or backup to others.

The software does exist and it depends on which of the digital modes you want to work.

One of the slickest RTTY,Amtor,CW programs COMPRTTYII runs on a DOS machine and uses a simple basic TU. The 8086/88 machine I have here still runs it. And it evens works great on my P3.

For PSK31 my old 486/33 with 3.11 runs PSK31 for Windows, from Peter G3PLX just fine...

Not in my country -- in Australia it is for experimentation.

From http://www.aca.gov.au/publications/info/amateur.htm:

"What is an Amateur licence?

An Amateur licence is issued to authorise a station that:
* is operated for the purposes of self-training in radiocommunications,
intercommunication using radiocommunications and technical
investigation into radiocommunications by persons who do
so solely with a personal aim, and who have no pecuniary interest in
the outcome of the operations of the station;
* is operated on amateur frequencies or amateur frequency bands; and
* may participate in the amateur-satellite service.

The Amateur Service is designed primarily to facilitate hobby
radiocommunications and for technical experimentation and operates
on specified frequency bands. Amateur radio operators communicate via
a number of transmission modes including, but not limited to,
morse code, telephony and data. "

For all practical purposes, either definition of purpose is essentially meaningless to Amateurs. Why? Simple. If I was to say that I wasn't going to train myself for national emergencies (US), or do experimenting (Oz), would I (could I) be penalised in any way?

All of that preamble waffle in the licences means essentially nothing when it comes to the practicalities how Amateurs must conduct themselves. Such statements are ideals, not mandates. You can tell the things that are mandated. They have penalties for non-compliance.

In Amateur Radio, if it's permitted, then you can do it for any reason that you like.

Mark.

If you don't want to go with a radio modem like a Baycom or Tigertronics but a TNC, the Paccomm PicoPacket TNC is the ticket. It's small like a pack of cigarettes. It has a jack to plug in a battery. It also has an optional battery pack, optional 2nd serial port, or even the option of a built in GPS. Check out:

www.paccomm.com

I use my Pico with a Casio handheld PC & an Alinco HT. I could run APRS either for CE or when it's connected to my old 486 laptop, I can run WinAPRS.

Good luck & 73's.

Hank Oredson <horedson@att.net> wrote:

> It was simply that proficiency in morse code is not very difficult.

For you, Hank. I have seen others struggle for a long time to get up to 5 wpm and pass the test.

Consider, too that when you and I learned the code, we started at 5 wpm and had PLENTY of people to talk to, letting us get to a higher speed "naturally." That is not really true today; a ham licensed at 5 wpm does not have the same QSO opportunities that we had, so the only practical way to get from 5 to 13 wpm is by listening to W1AW or using one of the code-practice softwares. It was NOT a natural for me; it took me about 8 months of 2-3 hours on-the-air operating every day to get to 13 wpm. If the only way I could have done it was by code-practice tapes, I would NOT have gone on to become a proficient CW op.

Consider too that when we were struggling at the 10 wpm barrier, we could tune the shortwave bands and hear lots of Morse CW sigs in actual use. I understood WHY I was being asked to learn this Morse thing; it was relevant to the radio technology of the day. When someone tunes the SW bands today, it is not at all likely that they will hear a Morse signal, so they do not get that positive reinforcement that we did.

What was easy and natural to us in 1960 is not as easy and natural in 2000, because many of the factors that made it so easy no longer exist. If it looks different to the newcomers of today than it did to us, it is because it IS different.

Now, from 13 to 20 wpm IS a bit easier; there are plenty of stations one can work at 13, 15, 18 and then 20 wpm. And you are right, those contests can be an excellent on-the-air code practice.

Reread the original posting. The poster was looking for digital
modes *with a sound card*. Which does not mean "a DOS machine"
with "a simple basic TU".

Sheesh.

It depends on your use, are you looking stand-alone or something
connected to a computer?
What mode(s) do you want to use and options?
You need to figure these out, then see what units offer what you
want and pick one.
Obviously a laptop would not last long on batt. power so it looks
like stand-alone operation, maybe with a Nicad batt. and a solar cell
charger, remember even simple can get expensive.

Do you have call letter license plates?

In Michigan to get call letter license plates you are really volunteering
you and your car for emergency services and are subject to call when such
arises.

Probably why they only cost $2.00 extra.

3377. Timewave DSP-599zx Upgrade Announcement

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-08-01 00:00:00 UTC
From: jdouglas@timewave.com
Message-ID: <8m7rahnb1@newsfeed.minn.net>
Source record: 11465

The new version 5.0 firmware for the DSP-599zx is shipping now. All back orders and dealer stock upgrades should be in place by early next week. For anyone who purchased a DSP-599zx after 01/01/2000, they can contact Timewave for free upgrades to version 5.0. All dealer stocks will have the upgrade kit in the box and will be marked with a sticker showing the upgrade is included. Be sure to ask your salesman.

Version 5.0 provides something for everyone:

Improved noise reduction algorithms for better clarity and wider bandwidth for SWL and broadcast listeners.

CW ops get two new tools, CW Spotlight for isolating the signal you want to work, and Binaural CW for copying that signal.

PSK31 and new digital mode ops get new PSK 31 filters, SSTV filters and PC/RADIO mode used to connect the soundcard audio in and out, along with PTT to your radio.

CW oscillator mode for practice and as a tool to check out TNCs and keyers.

Tanks for the bandwidth, This reaches hams world wide and in real time.

John,

Can you shed some more light on the PC/RADIO mode.

How do you connect the sound card's audio in and out lines to the
DSP-599zx?? Can you adjust (and attenuate) the audio levels to and from the
sound card?? Does the DSP-599zx provide any audio isolation??

Rob

> alone the POW tap code.

Tap code aside..... if you hang in there, Steve, you will find that at around 25wpm or so, the code becomes fun and conversational, rather than mundane copy. Once you reach that kind of skill level, then, it becomes just like talking on the fone, or the Inet. But, you will tend to find that those that can an do run that QRQ comfortably, have a lot to say, good yarns and history to spin, and can be great fun in a round table group of a dozen or so. You will also find, that once you reach that threshold, you really don't need the certificates and the diplomas with the gold stars.... the proof is then in the pudding, i.e., the ability to use the code. That is where it is at.....

Good Luck, and hang in there.....

Do I at LEAST GET HALF CREDIT for mentioning PSK31 for Windows by Peter G3PLX which runs just fine Running under 3.11 on my 486/33.

Which while its "Unlikely to do the Job" becuase doesn't it have "brute CPU power" and being this slow most certainly "will not be viable" Runs just fine. Althought I probably shouldn't even have thought about using it as its only a 486.

What was I thinking..?
Sheesh

3382. Timewave DSP-599zx Firmware Upgrade

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-08-02 00:00:00 UTC
From: "Casey (KC)" <casey@techie.com>
Message-ID: <M6Qh5.37$juZ4.1310739@tomcat.sk.sympatico.ca>
Source record: 11470

Here is the info from their web site... http://www.timewave.com/

Timewave Technology Inc. has extended the leading edge technology that has made the DSP-599zx the #1 signal processor in HF communications. Today, you can find the DSP-599zx and its technological derivatives in commercial, government, aviation and military HF communication systems worldwide! But we didn't build a flash-in-the-pan - when the DSP-599zx was designed in 1995-96, we looked forward and created a hardware and software architecture to carry us into the next millenium. The following new features are founded on that powerful architecture.

. Binaural CW
Binaural CW enables the CW operator to use the powerful combination of his brain and both his ears to separate CW signals in a panorama with lower pitch signals to the left and higher pitch signals to the right. This exclusive feature makes CW listening easier and takes the pile out of pileups!

. CW Spotlight
The CW spotlight highlights a weak signal to pull it out of surrounding QRM, and allows a proficient CW operator to monitor nearby CW signals while staying focused on a particular signal. This unique feature is great for DX pileups and contests.

. PC-Radio Interface and Filter for PSK-31
PSK-31 and SSTV require connection and matching of a radio's audio input/output and transmit/receive control line to a computer sound card and serial port. The DSP-599zx with Version 5.0 firmware performs these tasks while maintaining the ability to perform its other signal processing tasks. You can now operate RTTY, PSK31 and SSTV with just the DSP-599zx, a transceiver, and a computer with appropriate software. No other interface boxes or multi-mode controllers are required!

This new feature includes an internal reconfiguration of the signal routing and audio level adjustments in the DSP-599zx that permits the DSP-599zx to be connected directly to a sound card in a computer.

.Noise Reduction Algorithm Modification
We've tweaked the DSP-599zx's noise reduction algorithm for a better low end response for SWLers and improved noise reduction over the entire range.

.Morse Code Practice Oscillator
This one wasn't much of technical stretch for our engineers, but our customers wanted it! Even 5 words per minute takes some practice. Just plug in your key and start sending!
The manufacturer's suggested retail price for the DSP-599zx Version 5.0

firmware upgrade kit is $59.95.

Timewave is beginning production immediately and will begin shipping the DSP-599zx Version 5.0 firmware upgrade kit the week of July 17, 2000. Order now if you want one right away - it may take a few weeks to fill all the backorders.

Look for a special DSP-599zx to computer cable kit to be announced in the next few weeks. Although you can connect the DSP-599zx to a computer with standard cables from Radio Shack, we can save you time and trouble by offering the cable kit along with your DSP-599zx Upgrade kit. We also offer custom cables to connnect most transceivers to the DSP-599zx and the PK-232/DSP and other TNCs.

If it does the job for you, more power to you. I tried it on
a 486/66, wasn't happy with the results, and shelved PSK31 until
I upgraded. My anecdotal evidence (which is all it is) says it's
not viable. Your anecdotal evidence (ditto) says it is.

The logical conclusion is that PSK31 is borderline on a 486.

A beginner might have difficulty getting it to work. Hence the
strong recommendation to consider another approach.

>
>Rob
>

Hello Rob,

I am running an FT1000D with a DSP-599zx for SSTV, HELL and PSK31. the connections are as follows:

Sound card OUT to Audio B IN on the DSP-599zx, 1/8" stereo plug to RCA plug
Line B OUT to sound card in, 1/8" stereo plug to RCA plug
Computer serial port to DSP-599zx RTS in , Standard 9-pin to 9-pin serial port cable. NOT a null modem cable
PTT out to TX PTT in on the FT1000D, RCA to 4-pin DIN on my radio
RADIO RX Audio to DSP-599zx Audio in A in, I'm running with -3db
DSP-599zx Line AOUT to RADIO TX audio IN

All of the inputs and outputs of the DSP-599 are programmable. We extended the ranges of these to accommodate a number of different radios. (I used the DSP-599zx to set the line out in the DSP-599zx so the TX is not overdriven. This is the most critical adjustment of the bunch.)

The complete manual supplement for version 5.0 upgrade including the PC/RADIO mode will be on our Webster shortly.

For those radios and systems that require absolute isolation between the radio and computer (most do not; neither my FT1000D nor Randy's IC756 required additional isolation). We will have an announcement concerning those radios that do need extra isolation on the web within the next few weeks.

Hi guys

Despite the fact that I have been licensed on HF for several years, I am a newbie to digital modes. I currently have an AEA PK 900 with which I work vhf packet but I have not managed a single contact on hf on any of the advertised modes (Amtor, Pactor).and one very brief contact on RTTY but this lasted less than one minute.

The rig I use is a Kenwood TS-440S which has been doing a marvelous job all these years on all modes (has FSK mode for data) and is in perfect condition. Some of the names that have come up in conversations with other hams is Hal. I had a Kantronics on loan for a while and was not impressed by its performance - mind you that was a few years ago and the quality may have improved some. It just did not seem able to pick out weak signals.

One of the recent issues of CQ magazibe ran a story on the Hal and the reviewer seemed to like it a lot.

Ideally, I would also like to use it for satellite work (phase rd etc) but it sems to me
that it simply is not possible to get all modes in one package.

I would also like to know which are currently the preferred and most popular data modes

I would greatly appreciate any and all advice from you experienced bunch as to which way to go. Getting the gear to South Africa is not a problem as a friend from New York is coming to visit me in December and has kindly volunteered to bring it along

I am going to post this same message on the other packet boards as well in case some guru only reads the one board and misses it. No offence intended/

73's and all the best

Kind regards

If you were thinking of CW, and would like to use a paddle keyer.

This is an ORIGINAL BENCHER BY-1 KEYER PADDLE

CONSIDERED TO BE THE ROLLS ROYCE OF KEYERS

Full range of adjustment in tension and contact spacing
Self-adjusting nylon and steel needle bearings
Gold plated solid silver contact points
Precision machined, chrome plated brass frames
Heavily weighted base with non-skid feet
With cable and plug for Yaesu FT-847, Icom IC-746 and others
Black base with Chrome Components
Made in U.S.A.
In as new conditon

I have version 2 running and the concurrent spectrum and waterfall is really nice. Also new is the additional logging features. Also new is more macros.

In fat the only thing missing in my opinion is TRUE capture file ability. It dose let you save the rx buffer but does not let you do a true capture where all is saved as it is received.

It would also be nice to have a key to clear ALL windows or a macro sequence to clear all windows that you could assign to a key.

It is slow to individually clear the Rx1 Rx2 and Xmit windows.

I found that although the help file say that paths do not work for files in a macro, they do. I use path in my macro and it works fine. , <c:\doument\filtest> works fine in a macro.

This is good because rearguing them to be in the exe folder is not good.

The only problem I had is that if you try to change all the font things at the same time it crashes the program, not the system (WIN2000 though) and you have to restart and lost all the changes.

It also crashed when I tried to use Tune Key while the rig was turned off.

All in all , very nice program. It is hard to decide between this and Zakanaka.

For me, on Pactor, at least, I need to send a 'really long CQ' in order
to get responses. Typically, I'll make a macro for my COMM program,
and let it run for awhile, while I do other stuff -- but within ear-range, so
I can man the keyboard if someone comesin.
Do you hear people trying to call you, and it doesn't
connect? Or are you just not getting any response at all?

If you look in the SoftKiss folder, you should find a picture of the diagram.
I'm not sure this version has it:

ftp://oak.oakland.edu/pub/hamradio/mac/digital/NET_Mac2.3.57.sea.hqx
(or in that directory)

If you can't find it, let me know, I'll e-mail it to you.
The PowerBook 145 should be fine. I think there was something you had to
do so that it doesn't turn off the serial port to save battery power. Let
me know how it works out, I'll be trying to get packet working on my Mac
anytime within the next 3 months...(time permitting)...

To reply remove the *nospam part.

best,

Erik

>I think this is but a pipe dream. But perhaps I am being unnecessarily
>pessimistic (given that I work in related fields). Perhaps you can
>expand on what you mean. What can an Amateur Radio Operator (ARO) do
>that could not be done by a trained emergency organisation operator?

I can provide an example from here in Hawaii. The counties ("islands")
are almost completely dependent upon amateurs to provide emergency comms
during disasters. Here in Oahu County, we have 150 evacuation shelters run
by the Red Cross, and each is manned by a ham for comms back to RC HQ and
the civil defense EOC. Oahu RACES has over 100 members, willing to respond
at a moments notice to provide comms. Each police sub-station has amateur
equipment in which RACES members will man during an emergency. Amateurs
have installed repeaters to support Oahu County during disasters.

Now you ask, "what can an ARO do that can't be done by a trained
emergency organization operator?" Consider just the cost alone of
the county funding the above manpower and equipment which hams provide
free of cost.

This system was put into operation just this last weekend when
the state was threatened with an approaching hurricane. As usual,
it worked smoothly, (with yours truly getting his picture on the
front page of the newspaper [see:
www.honoluluadvertiser.com/2000/Jul/31/index.html]).

In addition, all hospitals belong to the Health Comm Network with each
hospital having licensed amateurs on its staff. During a disaster,
these hams provide intra-communications between the island's hospitals
sharing information regarding number of beds available, supplies on
hand, supplies needed, along with a dozen other vital pieces of info.

>Unless that ARO is current with the emergency network's protocols, is
>that ARO a help or hindrance?

We offer numerous training sessions and exercises which are usually
well attended.

>Being both a professional in radio and an Amateur, I don't have such a
>Black & White view of the radio world. Hobby activities have a much
>broader function that providing a pool of people trained to professional
>level in that activity - usually, they don't.

Note that the U.S. Government, in its regulations, never refers to amateur radio as being a hobby but rather a service. Our charter reads as follows:

97.1 Basis and purpose.
The rules and regulations in this Part are designed to provide an amateur radio service having a fundamental purpose as expressed in the following principles:
(a) Recognition and enhancement of the value of the amateur service to the public as a voluntary non-commercial communication service, particularly with respect to providing emergency communications.
(b) Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art.
(c) Encouragement and improvement of the amateur service through rules which provide for advancing skills in both the communications and technical phases of the art.
(d) Expansion of the existing reservoir within the amateur radio service of trained operators, technicians, and electronics experts.
(e) Continuation and extension of the amateur's unique ability to enhance international goodwill.

> IMHO, the main advantage
>of a hobby activity is to provide a wider community appreciation of that
>area of activity.

Does your Australian government consider amateur radio a hobby?

73, Jeff KH6O

I have a PK-12 that I'm trying to get working with winAPRS. It seems to be getting data from MIC-E (a TinyTrak actually) wrong. I have set afilter to off, and mfilter to 0, but no help. At first it was just dropping a digit from the longitude, but latitude also doesn't seem right. Same thing with my PK-232. Has anyone else had this problem or have any ideas?

big snip..... You know this world is just full of funny things. There is a limitless supply of situations which would justify comedy. The death of 100 plus people is not one of them. I only feel sorrow for the writer or sender of these "jokes" as he apparently does not share the loss even in some small form of 100 plus souls and the sadness that befell the thousands of family, friends, co-workers and such. I pray that those who died have eternal peace, that the family and friends also find what peace as can be had on this earth and also for the writer s and senders of such "humor".

God Bless ..... Tom KI3R

It's hard for me to believe that the next president of the United States will be George W. Bush or Al Gore. Both remind me of Hollywood movies that have been focus-grouped to death: they push all the appropriate buttons, but have zero original vision. Both stand for the same thing: corporate-driven business as usual.

There must be some way outta here.

Ralph Nader is no joker or thief. I think he and the Greens could give Al & George a good run for their money. At 65, Nader isn't running as fast as he used to, and the Green Party doesn't exactly have its platform figured out, but I think they have what it takes to inject a dose of radical democracy into the race. Unlike the two Tweedles, Nader is real, he stands for decency and common sense and he still commands a lot of respect in progressive and activist circles. And hidden behind the rainbow coalition of lefties, eco-feminists and crazies, the Green Party does have some great ideas. It's the only party that stands for the Tobin Tax, true cost markets, media reform and putting corporations in their place.

In October, with a fired-up Nader hurling intelligent sound bites into the presidential debates, the whole game show might actually be worth watching. The alternative is the most sophomoric presidential race in American history . . . and the lowest voter turnout ever.

I'm putting a GO GREEN - VOTE NADER graphic at the end of all my emails from now on. I'm betting that, between now and November, the American people will wake up to the fact that their sacred democratic experiment has now degenerated into a choice between a corporate-sponsored Republican and a corporate-sponsored Democrat.

In these heady post-WTO days, a sudden, massive protest vote against Al & George is entirely possible and Nader would be the most apparent heir. With perhaps less than 25 percent of the people voting, an inspired Nader campaign could grab a surprising share of the action. And even if he does not come close to winning, at least imagine how his campaign might pull together some of the fired-up, post-WTO forces and lay the groundwork for something really visionary in 2004.

Download the graphics and help launch an email pyramid scheme to dump the Tweedles! Two formats are available, a magazine

sticker (17K) or a Banner ad (5K):

==========

What it Means to be Green

"At the root of all Green political action is nonviolence, starting with how we live our lives, taking small, unilateral steps toward peace in everything we do. Green politics requires us to be both tender and subversive. Affirming tenderness as a political value is already subversive. In Green politics, we practice tenderness in relations with others; in caring for ideas, art, language, and culture; and in cherishing and protecting the Earth. To think Green is to build solidarity with those working for social justice and human rights everywhere, not bound by ideologies."

-Petra Kelly

Hmm, that @@M10 doesn't look good. Not sure where
that is coming from. Are you in terminal mode, as opposed
to "host" mode?

Find a way to get rid of that, as it isn't in the protocol.

>required.

The WA4DSY RF modem requires a signal strength of about -110 dBm
to maintain a 1 in 1E6 bit error rate. But that's the signal strength at the
modem's 29 MHz input. The transverter ahead of it may have gain, as
may the antenna, so the off air field strength may be considerably lower.
(Typically with our setups about -140 dBm is the point where bit errors
exceed 1 in 1E6.)

We run a pair of 56 kb stations over a 70 mile path. The stations run
about 4 watts transmit power, as do all of our sites. It is a mountain top
to mountain top LOS path, though, and we use a long boomer gain antenna
at one end. The path is very reliable. But we have another path that is
only 18 miles, but obstructed, that has periods of high errors, correlating
with the formation of an inversion layer over the area on summer evenings.
One site is above the layer, the other is below it.

We run much longer frames than that (that limit is forced by some TNCs,
but we don't use TNCs, and set frame lengths of between 1k and 4k bits),
and run a large maxframe too, but you're right that latency becomes a very
serious problem as multiple hops are traversed in a simplex digipeating
environment.

We do that, using 222 MHz and 440 MHz. You need two transverters,
and usually two antennas too, so it isn't a really popular approach for
users. It is worthwhile for node to node links though.

>The use of a half duplex (phone) repeater is simpler, since only this

We do that too, on 440 MHz. It is more popular with our users since the
equipment required at their stations is simpler, ie only one transverter
and antenna.

>>I still don't know how to work mobile unless just having lots of digipeaters.

Or just run pure Aloha and tolerate the collisions. The latter works ok,
expecially if you implement a random exponential back-off algorithm,
if the frequency is not very congested. You will eventually get congestive
collapse (or just as bad, back-off to practical infinity) if too many stations
are on, though.

We have done some mobile work (digital voice), and the multipath
problems aren't horrible, even on 222 MHz, until you stop. As you
say, you always seem to stop in the null. Of course digital voice
is quite tolerant of bit errors, unlike data transmissions.

3410. Next Saturday PSK31 relay experiment

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-08-06 00:00:00 UTC
From: kf4sir@earthlink.net
Message-ID: <398ed14f.2097499@news.earthlink.net>
Source record: 11353

Hi all, next Saturday (Aug 12,00) KF4SIR (QTH Orlando) will be running a relay experiment to see if PSK31 can be used to send e-mail messages.

Will be running contest style auto CQ on 14090Mz + 1500Hz starting at 8:00AM EST until 11:00 AM EST. Will try and run second session from 8:00 PM until 11:00 PM EST. Will also be trying QPSK for the last hour in the first session and the first hour in the second session.

UTC times and more information available at:
http://psk31relay.net

Please stop by if you can and be part of this interesting experiment. Will only need to copy one short message - should take less then 1 minute.

Thanks, Dale

I am not "seasoned" with packet radio or the soldering iron but wonder if the following can be done with simplicity:

Dad (newly licensed) goes RVing across the US from time to time. Can he use packet radio connected with a palm pilot to send messages from varying locations to my email address? (His location changes every 1 - 3 days and it would be nice to keep in touch and know where he is.)

Is there a way that I could email (I'm not set up on packet yet) messages back to him that could be held at a BBS where he could pick them up via packet? Could he somehow connect by packet to the same BBS to receive any messages?

For this to work it needs to be kept relatively simple. If it became complicated Dad probably wouldn't want to be bothered by it.

I hope that this is being done already. Wouldn't it be wonderful to be on the road, pull into a place, fire up the radio and send off a quick packet message that you have arrived safe, how your day went, and where you expect to be tomorrow. Then with a minimum of packet commands receive any messages from home.

If you can give me direction or advice in this regard I would greatly appreciate it.

Thanks in advance,

David Bell (KC7CNA)

there was an article on how to do this in either QST or CQ within the last year. Some one could search the indexes for the article. It dealt with using a palm pilot and a TNC with a mobile radio.

I will look to see if I can find the article.

The posters are a bunch of losers who have been spamming all of
USENET with their adolescent political activism.

Their website is, however, quite amusing in a useless-to-society
crunchy granola sort of way.

Are you sure about your sensitivity measurements ?

After all, we are talking about terrestrial links and you will have
the warm earth in the receiver antenna lower sidelobe, so maybe a 300
K antenna temperature is a reasonable quesstimate for VHF/UHF. This
corresponds to -174 dBm/Hz noise density and with a bandwidth of
larger than 10 kHz, the noise power would be stronger than -134 dBm
and you need some positive SNR, so the signal has to be in the -120 ..
130 dBm range even with noiseless front end. Even if you have 30 dB of
transverter gain ahead of your 29 MHz system, I do not think you can
get much better sensitivity than the -110 dBm level.

Of course, things get different if you are receiving the data from a
high orbit satellite in the microwave band, when you can have the
system noise temperature below 300 K.

IIRC "Microwave mobile communications" by Jakes even derives a formula
for the probability of stopping at the null :-).

While this old book (1974) is severely outdated when talking about
communication systems, the UHF/microwave non-LOS propagation part is
very interesting even today.

SPOKENWORLD NEWS
****
- It's Nationals time and you're going to hear it on Spokenworld.com. Four days of live slam from AS220 in Providence, RI! Here's the schedule as it stands now for the teams you'll hear live!

WEDNESDAY AUGUST 9TH
8:00-9:30pm Eastern Time Slot
1 Ann Arbor, MI
2 Roanoke, VA
3 Hot Springs, AR
4 St. Louis, MO
9:30-11:00pm Eastern Time Slot
1 New Jersey
2 NYC-Nuyorican
3 Memphis, TN
4 Mesa, AZ

THURSDAY AUGUST 10TH
8:00-9:30pm Eastern Time Slot
1 Minneapolis, MN
2 Albuquerque, NM
3 West Palm Beach, FL
4 LA CA
9:30-11:00pm Eastern Time Slot
1 Cleveland, OH
2 Worcester, MA
3 Chicago-Green Mill
4 San Jose, CA

FRIDAY AUGUST 11TH (All times Eastern)

What: TEAM SEMI-FINALS COMPETITIONS
When: Bout 1: 8:00-9:30pm
Bout 2: 9:30-11:00pm

SATURDAY AUGUST 12TH (All Times Eastern)
What: FINALS
When: 8:00-11:00pm

Hear them all from one link:
http://audio.netradiolive.com:554/ramgen/encoder/spokenworld/slam.rm
This broadcast utilizes the broadcast technologies and systems of SpokenWorld.com in conjunction with NetRadioLive.com, the webcaster's best friend. http://www.spokenworld.com/Performers/2knationals.htm

THERE REALLY IS OTHER NEWS
- UNDER THE BAOBAB TREE WITH SHANTA & LAJADJIE - It's coming, the new and exciting Storytelling Show for Spokenworld.com. New on Sundays. More details to follow!

- July Website Stats. According to Superstats, the site saw 453 Page Views for the month, up from 234 in June! While this is great, the webtrends report due later this month will tell the real story.

- Send your opinions and thoughts to Bob@spokenworld.com .

- As always, feel free to send us your material and let's see if we can get it on the air. Comedy, performance poetry, storytelling, whatever. If it's spoken word, we'll at least listen to it. email, yeah, you got it, bob@spokenworld.com for more details.

- Join the Spokenworld2U list. talk to others that enjoy spoken word as much as you do. email list@spokenworld.com and type in the body of your message: subscribe spokenworld2u "your name". That's it!

WHAT IS THIS NATIONALS THING GONNA SOUND LIKE?
Listen to the links below to the 2000 Essenzaslam Championships held in Mesa, AZ. Multiply this times a factor of, say 1000, and you'll get pretty close:
Round 1, part 1:
http://audio.netradiolive.com:8080/ramgen/inkwell/slamoff1.rm
Round 1, part 2:

http://audio.netradiolive.com:8080/ramgen/inkwell/slamoff_1_1.rm
Round 1, part 3:
http://audio.netradiolive.com:8080/ramgen/inkwell/slamoff_1_2.rm
Round 2: http://audio.netradiolive.com:8080/ramgen/inkwell/slamoff2.rm
Round 3: http://audio.netradiolive.com:8080/ramgen/inkwell/slamoff3.rm

****
RADIANT READINGS
****
The August 10th show will be Langston Hughes
Here's the stream link:
http://audio.teralynx.net:554/ramgen/encoder/inkwell/readings.rm

Radiant Readings, hosted by Sharon Skinner
Thursdays at 8p-9p PDT
Archived Shows available at the Radio Show Website

Sharon Skinner reads the work of both Classic and Contemporary Authors, providing insight and discussion into their work. Last week was Anne Sexton and that show is available for listening to at the SpokenWorld.com website (http://audio.netradiolive.com:8080/ramgen/inkwell/Radiant/radiant10.rm). Here's the link to the show's home page to listen to the many other archived shows:
(http://www.spokenworld.com/radio_show.htm#Radiantreadings).

****
NEW ON SPOKENWORLD.COM
****
-Taco Shop Poets ROCK!. Hear the new CD, Chorizo Toungefire, on Spokenworld.com and order it from Calaca Press (http://members.home.net/calacapress)

- This month's survey . . .
Is Napster of Value to SpokenWord Artists? Cast you vote now on the Spokenworld Homepage!

- UNDER THE BAOBAB TREE WITH SHANTA & LAJADJIE - It's coming, the new and exciting Storytelling Show for Spokenworld.com. New on Sundays. More details to follow!

3426. testing soundmodem in linux

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-08-07 00:00:00 UTC
From: Richard Barry <rbarry@ing.sun.ac.za>
Message-ID: <398ED366.671A60E6@ing.sun.ac.za>
Source record: 11364
Cross-posted to: rec.radio.amateur.digital.misc,fa.linux.hams,alt.radio.amateur

I'm at the stage of having a kernel (2.2.16) with soundmodem support compiled into it booting without any error messages. I installed the ax25-utils and I can bring up the soundmodem using ifconfig. When I run smdiag I can actually see whatever I input on the mic-in line of my soundcard (ESS Audiodrive), so it seems like it's working. How can I test if the modem is working correctly, first the transmitting and then the receiving? I have an oscilloscope and signal generator I can use if necessary. Can I just connect the earphone output to the oscilloscope, run a terminal program that outputs to the ax25 port (how do I do that?) and see if it does something on the scope? Can I then onnect the output to the input directly and see if I receive what I send?
Please email me derictly if possible, I will then try and put something usefull in the way of a tutorial together to maybe add to the AX25-howto.
Thanks
Richard Barry

> Is a point-to-multipoint transmission possible? How many stations can
> connect to a single point of presence?
>
> Which DECT modems should I choose?

And what is the maximum bandwidth?

http://www.dectweb.com/CreatingProducts/modules.htm

Modules for DECT, RF and OEM

DECT Hardware Modules

Several companies are now supplying DECT OEM modules, in some cases RF only
and in others full RF and baseband modules for OEM products - handsets,
basestations and other applications. Amongst these are the companies listed
below. If you know of others, please advise us.
DECT protocol software modules may be found on the Protocol Software page.

Several companies also offer design services with licensing of designs - see
our Design Solutions Page

Applications of DECT Modules
As well as telephones, DECT modules can be used to connect wirelessly a
range of other information processing devices, such as a palmtop computer,
enabling exchange of data, such as up-to-date schedules, calendars, and
databases. Combined with telemetry or telematic systems, DECT systems can be
used for the remote control of alarm and security systems for appliances
such as washing machines or cookers. In the commercial environment DECT
modules can be integrated into existing equipment or systems - for example
enabling customers in a restaurant to pay for their meals with a credit card
online at the table.

ALPS
Company website
ALPS produce RF modules, which are sold along with software from S3)

Digades Ltd
Company website
DFM250 basestation module
Download product Data in pdf
Download product Handbook in pdf

DFM251DECT module
The DFM 251DECT is a further development of the DFM 250DECT which offers greatly decreased size (PCMCIA cards are also possible), lower energy consumption, the development of telephony functions in accordance with the GAP standard and the execution of high-speed data transmission. DECT time slots, in which data is transmitted, can be bundled, allowing a gross data rate of up to 192 kBit/s to be achieved. The module allows simultaneous transmission of data as well as voice. Up to six portable modules can communicate parallel with a basis module

Fraunhofer IIS
Company website
The DECT M2 radio modem - click for a picture
The M2 module allows wireless data communication between a basestation and one or more mobile stations in accordance with the ETSI DECT standard. The module is connected by a 16 pole connector and uses a serial interface communicating with simple AT-commands and data transmission rates up to 57,6 Kbit/s, with TRS/CTS hardware handshake and support of modem signals (DTR, DSR, DCD, RING). An identical module can be used for base and mobile stations for integration into a terminal device. Custom-made solutions can be offered

Size: 80 x 60 x 12 mm
Operating voltage: 3.4 V - 4.7 V (tolerant of up to 5V)
Data interface: TTL compatible data and handshake signals.
Transmission rates: Net data transmission rates, with FEC, up to 24 kb/s
Up to 5 mobile parts may be registered to one basestation by over-the-air transmission or by data interface
Integrated antenna
Range: approx. 40 m indoors, approx. 300 m in free field
Approvals: DECT TBR 6 EMC standard for DECT equipment

The DECT M3 radio modem - click for a picture
The M3 module - an update of the M2 module, supporting simultaneous voice & data.
Preliminary data:
Configuration as a base station or mobile station possible
Direct connection to loudspeaker and microphone
Operating voltage 3.6 V +/- 5%; 3 Ni-Cd cells operating possible
Serial V.24 interface with baud rates of up to 115.2 kbit/s, with RTS/CTS hardware-flow-control and support of modem signals (DTR, DSR, DCD, RING)
Coverage area: up to approx. 40 m indoor, up to approx. 350 m in line-of-sight.
Integrated antennas ~
Download information

The DECT M4 radio modem - coming 2Q2000
The M4 module - a variant of the M3 module -10/+50 Celsius.

B3 Basestation Platform
The DECT basestation B3 is the third generation of the DECT radio module developed by the Fraunhofer Project Group for Wireless Telecommunication and

Multimedia Technology. According to the network specifications, different DECT data service profiles can be offered and implemented.
The B3 provides:
* two serial V24 communication interfaces, up to 115.2 kb/s
* one LAN interface -10-base-T, IEE802.11 compliant
The B3 is based on a 16 bit RISC controller and an OEM RF-part.
The RF-part supports antenna diversity and can maintain up to five DECT connections simultaneously.

Core 51 Radio Module
[Ed - No longer included on Fraunhofer website]
This radio module allows digital data communication between a base station and one or more mobile stations using DECT standard and comprsies an 8-bit microcontroller and OEM-RF-part
Size: 80 x 52 mm, height: approx. 18 mm
Operating voltage: 3.45 V or 5 V operating voltage
Serial interface with FIFO, RTS/CTS Handshake
Data transmission rates settable up to 57,6 kbit/s
DECT-standard: frequency- and time-division- multiplex
Frequency band 1,88-1,90 GHz
Range: approx. 40 m indoors, approx. 300 m in free field
Serial interface for data transmission (CMOS voltage level) processor interface
Antenna port (base station also feasible with antenna diversity)

Fraunhofer also offer customised soft- or hardware such as interfaces, outline, and support conformance tests to CTR6 standards for large-scale operation.

Hoeft & Wessel
Company website
Hoeft & Wessel is a company whose main business lines are the development, production and distribution of hard- and software with a specialisation on complete system solutions with developments mainly centred on devices for Mobile data acquisition, Electronic payment, Ticketing, Telematics & Parking. In recent years they have introduced a range of products using DECT technology and are now offering DECT modules to other companies wishing to use the technology.

HW 86045 DECT transceiver module - Picture
Easy to integrate, Small footprint, Wireless circuit data , Supports point-to-multipoint

HW 86096 DECT transceiver module - Picture
High-speed wireless data transmission , General I/O interfaces , Prepared for voice services , Hub for point-to-multipoint

HW 86010 DECT transceiver module - Picture
Highest integration, smallest footprint , Versatile interfaces for voice and data , Full network support , Prepared for voice service

Inventel
Company website
INVENTEL is a French based design house and manufacturer of radiocommunication products who have developed a range of DECT phones for residential applications, as well as a DECT GAP module, the MDG601.

The MDG601 is available in different software versions:
- wireless serial link with the S3 software
- full GAP module for voice application
- voice and data for mixed application

MDG601 summary - Download the full details
Interfaces - RS232, TTL 3 V
Operating voltage - 3.3 V
Approvals to TBR 6, TBR 10 and TBR 22
External dimensions: 48 x 35.5 x 8.5 mm
Temperature range: +0°C / +40°C
Integrated antenna

IZT - Innovationszentrum fur Telekommunikationstechnik GmbH
Company website
IZT is the industrial exploitation route for DECT M2 module product developed by the Fraunhofer IIS, see above.

RTX Telecom
Company website
Discontinued - RTX1921/22 DECT radio transceiver modules - see the item on the News Page
The RTX1921 and RTX1922 are DECT radio transceiver modules intended for use in low-power, portable terminal and basestation applications. They are compliant with ETS 175-2 and CTR6, as well as the Generic Access Profile (GAP) specifications. Type approval testing reports can be provided upon request. The RTX1921 is intended for use in a portable part (handset), and the RTX1922 with its diversity antenna feature, is intended for application in a fixed part (basestation).

Click for the pdf data sheet

Samsung
Samsung offers two DECT RF module products:
* RU1890H10KRA for use in handset products
* RU1890B10KRA for use in basestation products
These are based around Infineon (Siemens) chipsets

Siemens
MD32 DECT Engine
The Siemens MD32 DECT Engine was first shown at CeBIT99. It promises to be both high quality and good value, given Siemens dominant position in the DECT marketplace, which should offer them good scale economies. At CeBIT99 Siemens showed an application of the module in a palmtop computer.

The size of the MD32 DECT Engine is 65x37x5 mm and it can be used for transmission of voice and data, with a 4-pin audio interface and RS232 serial port. All the data transport aspects are handled by the module,

transported using the U-plane LU10 data service, guaranteeing a BER of 10-8.
Find details, including brochures, on the Siemens DECT Engine website or their alternative site

Gigaset DECT "Simcard" - World's Smallest DECT Engine
The new Siemens DECT engine is taking DECT into territory until now claimed by Bluetooth, in terms of form factor.
Size 24 x 14 x 3.5 mm = 1.2 cc, one third the volume of its predecessor, the "Stamp" (see below).
The new product is likely to be a hot topic when it goes on public display at this year's event, CeBIT 2000. Clearly at this size the potential for integrating DECT short range links into PDAs, mobile phones, etc takes a big leap forward.
Download the new Siemens Gigaset Simcard brochure

You can also download from here a Siemens DECT PowerPoint presentation (zipped, but still big !) given at last year's Bluetooth Developers' Conference

Gigaset DECT "Stamp"
Engine for cellular phones, PDAs, etc
Shown at CeBIT '99
Size 24 x 27 x 5.5 mm = 3.6cc
RS232 interface
0 dBm transmit power

The simplest is to just connect it to the transceiver and connect someone.
When it doesn't work, you can always try to find out where it is failing.

3436. Trouble with KAM Allmode!

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-08-08 00:00:00 UTC
From: Holger Korioth <hkorioth@cityweb.de>
Message-ID: <39902A44.7DD5DDAF@cityweb.de>
Source record: 11374

Hi Folks!
I have here some trouble with an KAM Allmode Controller.
The KAM with itï¿½s original Firmware 2.85 works fine, an Update
with v6.1 (for the KAM without Enhancement Board) produces a
RAM error in Test mode.

After an Hard-Reset (Jumper K6) this Data appers on my Terminal

EEPROM INIT OK <= changed to 24c16
CHECKSUM OK <= the Eprom, i guess
RAM ERROR <= ?
32K RAM <= RAM size (correct!)

After changing the RAM, the same failure comes up, the Adress- and
Data connections on the Printed Board seems also ok.

Changing to v2.85 let the KAM work fine, but i need the
PACTOR Mode from the v6.1.

Had anyone the same error on his KAM and a solution to solve
the Problem?

We have had numerous requests for the manual supplement for the new DSP-599zx firmware upgrade (Version 5.0).
The supplement is now available at:
http:\\www.timewave.com/DSP599UpgSupplementver1.pdf

Our emergency EPROM shipment arrived! All remaining DSP-599zx Upgrade backorders will be shipped by Monday, August 14. U. S. customers should have their upgrades by the Aug 18.

If you are a registered DSP-599zx owner and haven't heard from us about the DSP-599zx upgrade, it is possible that your email address has changed since you sent us your warranty registration card. . About 75% of the email announcements bounced - primarily those involving AOL, Compuserve and changed callsigns. Send us your current email address and DSP-599zx serial number to get our database updated. (Send it to sales@timewave.com)

Jim,

All you need is a standard 9 to 25 pin connector.. you can get them at any electroics store, or even radio shack. It's the same pinout as an external modem is.

Have any of you PSKers worked 15/17/30/40 lately?

Not that much activity-yet-but that's a bonus,unless you like trying to work a QSO in between all the traffic on 14.070, during prime time.

Hi All,

Seeing the "other" PSK31 Mailing list is very unrealiable, and all but disappeared, I have started one here in the states... go to Http://psk31.listbot.com or http://www.qsl.net/k8cpa/psk31.htm and sign up!

there are 102 people on there as of last night...

Everyone is welcome!

and BTW: I did get my kenwood ts-950sdx going on psk31... have worked alot of stateside and a few countries... Worked XE1M last night on 20!

3452. VB code for PSK31 utilising Moe's DLL

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-08-12 00:00:00 UTC
From: Colin Campbell <mm5agm@cableinet.co.uk>
Message-ID: <umll5.31141$V_2.2317177@news1.cableinet.net>
Source record: 11390

Hi All,
I am a bit disappointed to see that no one has released Visual Basic code that shows how to use Moe Wheatley's (AE4JY) DLL. VB isn't the easiest language to use with the DLL and it occurred to me that the lack of code could be because programmers couldn't get past the initial hurdles of sub-classing, to get to the messages sent from the DLL, and passing Arrays to/from the DLL. I have quickly written some code that decodes the PSK signal and shows how some of the Moe's functions work. I am working on the transmit side but have to admit that it doesn't work yet. My reason for writing this is to show others how to get past these initial hurdles. If you are a VB programmer and would like to write a PSK31 program using the DLL I will send you the code I have. (if there are too many requests I'll put it on my webpage) Note that this code is no use to you unless
you have Visual Basic 6. I am not releasing a compiled usable program for PSK31 because I think there are more than enough simple programs already. If you
want the code e-mail me and confirm that you have Visual Basic 6 so that you can compile it. If the above means nothing to you then PLEASE do not request the code!
Colin MM5AGM

> TNC to the radio, as if they could ever be effectively different

They usually are different. The TNC to Radio baud rate may be 1200 baud while the TNC to Computer (serial port) baud rate is usually much higher (9600, 19.2, etc). The serial port uses a handshake (hardware or software) to control the flow of data from the computer and prevent the buffers in the TNC from overflowing. A higher baud rate is used on the serial port in order to quickly fill up a packet during file transfers so it can get transmitted by the TNC. That improves the throughput. The total throughput is limited by the radio side though. The throughput for 1200 baud is less than 1200 baud because of the packet overhead (addressing, CRC check, etc). The more "real data" you can stuff into a packet, the more efficient it is.

Memory. A TNC is essentially a big buffer and a modem. With enough
memory you can fill up the buffer and then signal the computer to hold
off until it's through.

The TNC hardware is generally a microcontroller and very low horse-power,
so terminal baud rates are limited.

3457. help with BTL

3458. Stupid Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-08-13 00:00:00 UTC
From: Marc Passy <laikaservices@yahoo.com>
Message-ID: <399604FF.92CF6473@yahoo.com>
Source record: 11396

I've been reading up on Packet radio, and a question was prompted by something I read, and I can't find the answer. A couple of documents made a real point of differentiating between the data rate between the computer/TNC and the TNC to the radio, as if they could ever be effectively different. I understand data communications well, in general, and I was wondereing, did I mis-read, or is there really some effective difference?

I mean, if the highest effective bit rate out of the TNC is 9600, for example, how can I possibly get more throughput?

Thanks in advance.

3459. Re: Palm Pilot, Email, Packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-08-13 00:00:00 UTC
From: Walter Dunckel <walter@radiohound.com>
Message-ID: <8n5m07$88j$1@slb0.atl.mindspring.net>
Source record: 11397

The simplest way to do this would be to use APRS. APRS uses ONE frequency everywhere in the USA. It is on 144.390. With a GPS connected, it will show your dad's position to anyone who has access to the internet. It will also send and receive messages. Your Dad will be able to send E-mail, but will not receive E-mail. The station once set up is easy. There is PocketAPRS which will run on a Palm pilot. Of course you will need a TNC to connect the Palm to a radio, and GPS.

For more info on APRS here are some links.

http://www.findu.com/cgi-bin/find.cgi?k4hg-8 This is an example of what you would see from the internet, as your dad traveled.

http://www.qsl.net/kd4rdb/aprs.htm This is an introduction to APRS and more.

http://www.kenwood.net/products/index.cfm?AMA=open&ama_mob=open&radio=TM-D700A&selection=Amateur a radio with APRS built in.

www.radiohound.com info on the TH-D7 APRS handheld radio with Palm link to PocketAPRS

Hope this helps,

Let me know if you need any more information.

Walter

Hi all, I started a new list with web viewable content at:
http://www.egroups.com/group/psk31relay

This list is for experimenting with the use of digital ham radio for relaying messages from remote areas using ham radio to bridge the gap in communications then the Internet to make the information available to the public.

Lots more information at site in signature.

Thanks, Dale
Dale Coleman
kf4sir@earthlink.net
Check out my ham radio page
http://psk31relay.net
use PSK31 to relay messages.

So, in other words, the instantaneous datarate from Computer to TNC
should be higher that the radio DR, but the long term, effective
datarate will be dictated by the radio side, right?

I don't know about instantaneous, how about average?

Yes, the TNC will drive the "system" data rate. What normally
occurs, is the RF will fail, and the TNC will retry.

The computer should transfer its data quickly to the modem.
Modern modems perform FEC and compression on the data,
and this takes time (TNC's usually don't do this), so you don't
want to dribble the data in, you want to overdrive, and let the
modem tell you when to stop sending.

True. The system throughput is always limited by the slowest link
which in this case is the radio side.

Is it just me, or is this too good to be true. How many other companies would think to do this (post a general update on a news group). Needless to say, I don't own any Timewave equipment (I do have an old AEA PK-12), but if I'm ever in the market I'll remember this. Customer service is not dead!

From: David <david.oharrow@btinternet.com>
Message-ID: <8n9ltc$9m4$7@plutonium.btinternet.com>
Source record: 11407

Hi,

I am trying to locate a Science of cambridge (Later to become sinclair) Mk14 computer. The computer was available in a home built kit in the UK and, from what i am led to believe, many were sold to amateur radio enthusiast, as, at this time they were the only people experimenting with electonics in the home build environment. (Hence my reason for posting in this group)

If you have one, or any spares, or indeed any sinclair items ie radios, calculators, watches, etc, working or otherwise, that you would like to sell please email me as i cannot regularly access newsgroups.

I would also possibly be interested in early home computers from the late 1970 to the late 1980s. Preferably boxed but all will be considered.

Thank you in advance.

From: Steve Kallal <skallal@pacbell.net>
Message-ID: <sLmm5.91$Lt3.167309@news.pacbell.net>
Source record: 11412

I am trying to get a PSK31 setup going at home. I am able to get reasonable copy with a Sony Vaio laptop, but it belongs to my company and they want it back. My desktop machine is definitely not FCC type accepted. It uses a SuperMicro main board with a PIII 550 MHz CPU. I assembled it myself with generic parts from a local comptuer store. When ever I turn the desktop PC on, my receiver on 20 meters get several S units of noise covering all but the strongest signals. When I disconnect the antenna the noise disappears completely. The rig is around the room from the computer, about 6 to 8 feet or so. The antenna is located on the my apartment balcony at least 15 to 20 feet away.

My gut feeling is that the PC is not worth the trouble of trying to clean up. Perhaps I should try other PCs or find an older Pentium type laptop. Would buying a name brand PC with some sort of FCC type acceptance help. Does anyone have any suggestions? I am open to ideas.

Hi guys...

I've been busy playing today and have set up an English Web Site for MMTTY.

http://www.geocities.com/mmtty_rtty/
(if your typing this out, there is a _ [underscore] between mmtty and rtty)

I'm sure that there are things that can be changes in time and I'm open to your input. I will do my best to keep it current subject to available time. I hope this effort meets with the MMTTY group's approval.. Especially Mako, I hope this is OK with you.

Don't know what MMTTY is? It is a great RTTY (free) program that works with windows 95/98 and a sound card. The program is written by JE3HHT and up to a few days ago there was no help information in English. Guys in the new MMTTY group have been busy putting together English information on using the program. This is a great example of how we can work together!

Thanks to Andy, Mako and the group for assisting in the MMTTY project.

Well, there's 3 programs that I know of that you can use for PSK31...
There's twpsk(which requires LessTif), Phaseshift(which requires Qt) and
gpsk(which requires gtk). I prefer twpsk or Phaseshift.

Check 'em out, I've been successful with both Phaseshift and twpsk.

Where did you look before you concluded there weren't any?

The main three (gpsk31, phaseshift and twpsk) are all in the
Linux archive at metalab.unc.edu, waiting to be downloaded.
I've used twpsk and it works well.

Hello all, This is my first attempt at posting a message on the Newsgroup.
There is not a great deal of activity here in ZL land on digital modes. I am
currently working my younger Brother ZL3GE who is in Timaru in the South
Island while I am in Auckland in the North Island. We are going great guns
on PSK31 on 40 meters around 1600 hours our time 0400Z. and there are no
other signals monitored on this band.
I have worked some U.S. stations but propagation from here seems to favour
the european stations.
Cheers all 73.............Gerry ZL1AWW

Source record: 11418

Hello all, I have recently been operating PSK31 mainly on 20 meters.
Sometimes when I have called CQ I get a signal coming back without a proper preamble of my callsign de the other callsign and I don't know whether the station is coming back to me or starting to talk to some other station. I notice this a lot also on CW where stations responding to a CQ come up with just their callsign.
This is a plea to please think of the fellow at the other end who may have QRM or QRN and under such circumstances it is good operating practice to give his callsign clearly at the commencement of a QSO.
My own practice is that if I am responding to a CQ I give the station called at least three of his callsigns de three of mine so that it is clearly determined who is calling who.

3485. Portable - TNC / Radio

Hi All - I am relatively new to ham radio. I am about to purchase my first setup and wanted get some advice on the follow products. I would like to have a portable radio and TNC that I can take the top of mountains when I hike. Here are the two setups I am considering:

#1: Yaesu VX-5R Tri-band HT with a Katronics KPC-3

#2: Kenwood TH-D7A (TNC built-in)

I need a simple setup that does not weigh too much or draw too much power. If you have opinions on the options above or an alternate option, I would appreciate the advice.

John

>If anybody has got any suggestions I will be eternally grateful.

This can be extremely difficult to tackle, as you could be the victim of a
bad motherboard design. First try to disconnect as many leads from the PC
as practically possible (start out with only the mains lead) and see if
there still is that much QRM.

When there is, there may be hope. You apparently have a leaky (plastic?)
case, and should just discard it and build everything into a decent case
with metal shielding all around, and fingerstock that interconnects the
case plates (very important! a "slot"-formed gap in your case makes all
other shielding effort worthless, so watch out for slots along the lid)

When the QRM disappears by disconnecting the cables, it is apparently
radiated by the cables. When your cables already are shielded, and you
already tried the toroids, just discard or sell the machine. It will be
too difficult to make any improvements.

Hello John

You did not mention what/why use of the TNC. Are you going to use it for packet, APRS, or? There may be some options depending on your intended use and may reduce the size/weight of the radio/TNC you need to pack.

3490. Antenna Restrictions and Covenants

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-08-17 00:00:00 UTC
From: jack albert <jwa@tellabs.com>
Message-ID: <N9Vm5.17$0z3.87@wdc-read-01.qwest.net>
Source record: 11429

Trying to purchase a new house without Antenna restrictions or covenants is really difficult and
I'm a little bit confused on the FCC policies concerning the private contractual agreements.
(I snipped the FCC's comments on a petition that was presented by the ARRL)

I was told by a real-estate agent that restrictions and covenants are similar to leans against the property and
are held as public record at the County Dead Office. They are not signed by or agreed to by persons that
purchase the property. They are adopted by the land developers and I guess you can that they are policed
by the Home Owners Associations!

If I purchase the property and pay cash for it but I don't sign the covenant or agreement. How can that be an
agreement between two parties and how can I be restricted by the covenants?

----------SNIP----------

Federal Communications Commission DA 99-2

Federal Communications Commission
Washington, D.C. 20554

In the Matter of)
)

Modification and Clarification of Policies and)
Procedures Governing Siting and Maintenance) RM-8763
of Amateur Radio Antennas and Support)
Structures, and Amendment of Section 97.15)
of the Commission's Rules Governing the)
Amateur Radio Service.)

ORDER

Adopted: November 18, 1999 Released: November 19, 1999
By the Deputy Chief, Wireless Telecommunications Bureau:

-----SNIP---------
-----SNIP---------

III. Discussion
6. The Commission's policy with respect to restrictive covenants is clearly stated in the MO&O establishing a limited preemption of state and local

regulations. In the MO&O, the Commission stated that PRB-1 does not reach restrictive covenants in private contractual agreements.17 The Petitioner argues
that enforcement of a covenant by the court constitutes "state action", thus converting what otherwise would be a private matter into a matter of state regulation and, thus, subject to the Commission's limited preemption policy.18
Notwithstanding the clear policy statement that was set forth in PRB-1 excluding restrictive covenants in private contractual agreements as being outside the reach of our limited preemption,19 we nevertheless strongly encourage associations of homeowners and private contracting parties to follow
the principle of reasonable accommodation and to apply it to any and all instances of amateur service communications where they may be involved. Although we do not hesitate to offer such encouragement, we are not persuaded
by the Petition or the comments in support thereof that specific rule provisions bringing the private restrictive covenants within the ambit of PRB-1
are necessary or appropriate at this time. Having reached this conclusion, we
need not resolve the issue of whether, or under what circumstances, judicial enforcement of private covenants would constitute "state action."

Jack, I believe that a good way to view a covenant is that it represents a legally binding set of conditions on the *use* of the property to which it is attached. Covenants are filed with the County Clerk - at least in Texas - along with deeds, etc. The complete "package" for a piece of property consists not only of a deed, etc. but also of any covenants that have been filed.

So, there is no notion of a contract as I see it when you purchase a piece of land with a covenant filed on it. It spells out conditions of use which are legally binding. Effectively, you accept the conditions of use when you accept title to the property. If there are any elements of a contract, then you have effectively signed and agreed to the conditions when you accept title.

Now, this may be the situation only in Texas, but I believe that it is fairly universal.

When I bought this place (Texas talk!) I made sure that there was nothing that precluded antennas and amateur radio operation. <:}

Your real estate agent is correct. By becoming owner of the property you automatically accept all covenents and restrictions recorded with the county even though you did not personally sign off on them. The real kicker is that one of the covenents is usually that you agree to abide by the decisions of the governing board of the homeowners association. If 15 years from now they decide to restrict antennas you may be prevented from adding any new antennas (existing antennas my be grandfathered).

The only solution is to move to the country I guess.

I too suffer from horrendous QRM from my Pentium and no, it is not the
monitor. I have tried grounding the computer case, winding the leads through
toroids and if I throw it out the window then bang goes my chances of
operating. The QRM seems to be on set frequencies so I am forced to avoid
those spots.
If anybody has got any suggestions I will be eternally grateful.

Just got myself a laptop for the shack, P75 with Windows95. Rather than trawl endlessly through the various packages on offer I wonder if any one has advice or recommendations as to which software I should load up. I'd like to try SSTV, RTTY, PSK31 for a start, either via an adapter (which I have) or, preferably straight into the Mic in socket on the laptop. Also, a grey-line, great circle and sat tracking prog would be nice.

Thanks for any advice you can offer.

I won in a covenant battle over my 55 foot tower in Tucson Az. Actually it was damn easy. I claimed 'selective enforcement' by finding and documenting over 50 various violations of the covenant in my small neighborhood. The pond-scrum-sucking lawyer for the builder (there was still some construction going on) eventually threw in the towel. Didn't cost me a dime except for the processing of the pictures.

3500. Re: What software to choose

Message-ID: <8nj9t2kma1@nnrp1.deja.com>
Source record: 11441

Den replied:
I use TrueTTY for RTTY and PSK-31. It is great for RTTY but lacks a bit on PSK-31 recieive in noisy conditions. I like the convienince of just one package. The author also wrote Logger which works with TrueTTY. For PSK-31 there are better performers: Digipan, WinPSK, WinPSKse etc.

For Sat tracking there are a number that are good. One of the best is SSTPlus @ http://www.dransom.com/ designed to track the Shuttle it does a nice job on Amateur sats too! also shows grey line etc...
Also check out : http://celestrak.com/ a bit more complex but another nice sat tracker. There are more....

Obviously you will need more than program... I find it fun to have as many as I can and compare them!!! You didn't mention a logging program but you should consider one of those too! There are MANY. I use LogEQF ... it does almost everything a logger should and I have been using from the days when there were very few to choose from. I like its simple interface... some of the Windows loggers give you too much information!

You also may consider more than one computer..... I find 2 is the minimum.... one for logging and one for tracking or PSK etc. I have three networked together @ Command Central.... at times wish I had 4!
G'luck in your search...

Before you buy.

3501. 230.4 kbps system h/w available

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-08-18 00:00:00 UTC
From: Glenn Elmore <ge@sonic.net>
Message-ID: <399D6E49.1F6E260@sonic.net>
Source record: 11442

After many years of development and use, it looks like my moderate
speed (230-500 kbps)
packet hardware system is looking for a new home and caretaker. This is
hardware assocated
with the system described in the ARRL Computer Networking Conference
proceedings:

system:
http://www.sonic.net/~n6gn/arrlcnc/cnc.html
radios:
http://www.sonic.net/~n6gn/230kbps/230kbps.html
antennas:
http://www.sonic.net/~n6gn/antenna/antenna.html
digital interface:
http://hydra.carleton.ca/articles/hispeed.html

It has been in use in Northern California over the area

http://www.sonic.net/~n6gn/local/map3.gif

for about 10 years buthas recently been taken off the air and Internet.
I am now finding
myself moving on to other things and it seems a shame for useful
hardware to sit on the shelf.
The system consists of:

RF Hardware
Six complete:
radios, described above
antennas, yagis as above
Ottawa PI2 digital interface cards, described above
cables, radio->ECL/TTL_interface and ECL/TTL_interface->PI2
Some 9913 antenna Coax is probably available too.

Host PC's
previously running DOS/KA9Q but now running Linux to host the
PI2 cards and nodes as well
as internet services are also available. It should be noted that
due to a PI2 card-host
interface issue, older motherboards as on 486's tend to work
best. So even if you have
newer hardware to run on you might want to consider at least a
couple of these just to
have a running link or two as you bring up the rest. See the
PI2-users distribution
list for details on this known problem.

Over the last several years the system has handled many gigabytes of traffic over a ~100 mile network
of paths and is capable of handling many more. The 10 watt radios along with the simple yagis can
each support 50 mile or longer hops and the combination might make a good backbone system for handling
both conventional AX25 as well as TCP/IP traffic over a wide area. We have hosted web pages, run a
wide variety of tcp/ip applications, games, digital telephony, remote access/control over the system
and with the combination of speed and Linux 'development' environment many interesting uses
yet remain to be discovered.

I am interested in selling the hardware but also in seeing it continue to be put to good use
in amateur service. While the system has been working fine, installing and maintaining a
modest speed, wide area network requires effort and some expertise (which can be learned) in
a variety of areas including propagation, RF hardware, digital interfaces, operating systems
and networking concepts in general. It should not be taken on by somebody who only hopes to get
a turn-key wireless network at a bargain price.

If you are interested in this system please contact me at
n6gn@sonic.net and I'll be happy to discuss it further.

I also live in Texas, am NOT an attorney, but spent 6 years on a city planning and zoning commission in a suburban city. In this state covenants are attached as has been stated, but they are not enforced by any government agency, but rather by homeowners associations. If a development is sold with covenants, but there is no HA created, then those covenants are effectively null and void. A single neighbor could have the potential for forcing litigation, but then they likely would have to call into question all violations to the covenants effectively taking on the whole neighborhood. Not impossible, but not likely.

You might consider trying MMTTY for RTTY .... it's free so you can go wrong
with the price. Works with win95/98 and a sound card..

>> have) or, preferably straight into the Mic in socket on the laptop.

Try winmix32 for digital modes.Find it here;

http://users.nais.com/~jaffejim/mixwpage.htm

The PSK31 Homepage,with links for software-and suggested frequencies,
is here;

http://aintel.bi.ehu.es/psk31.html

The Digipan page,one of the very best programs for PSK,with an excellent HELP
file,is here;

http://members.home.net/hteller/digipan/

If you get into PSK,there are two email reflectors;

psk31@listbot.com
and
psk31@bipt106.bi.ehu.es

Hope this helps.

Thank you for reading my plea for help.

I am having a little trouble getting that fine digital program 'BTL' running.

Do you have that program installed ? and does it run okay?. If any person reads this, and can help me with the config,s, or whatever is required, I would be very grateful indeed.

3518. CONSUMER ALERT - Beware of Eucalypt Software - Makers of Autopost & Rocketfuel!!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-08-20 00:00:00 UTC
From: Warning-Warning@becvtaf.edu
Message-ID: <67437AEE.opgewfa@hcrkpdrv.org>
Source record: 11306

Eucalypt Software - Makers of Autopost & Rocketfuel --- Ripped Me Off!!!
-
All potential buyers should be warned to steer clear of this company. They have a repeated pattern
of ripping people off and ignoring requests for support.
-
I know someone who sent in the $10 registration fee for Autopost TWICE (thinking the first one may
have gotten lost) and in both instances, never got a registered version of the program and all of his
emails were completely ignored.
-
I myself purchased Rocketfuel on-line and had to pull teeth to get an unlock code. The web site was very
quick to take my money, but no registration/unlock code came for days and days. I repeatedly emailed them,
only to receive nothing but autoresponses. After 5 days I sent them a message stating that if I did not have
a working version of the program by the close of business that day, that I would challenge the credit card
charge. Magically, the code arrived several hours later.
-
What kind of way to do business is that?
-
In any case, its academic... there are other products available for free that do virtually the same thing
and I only wish that I had known about them before I wasted my time with Eucalypt Software.
-
If your in need of automatic news posting software, there is nothing better than "NNTP Power Post 2000".
It's graciously been made available free from the following web site:
-
http://net-toys.8k.com/
-
Save your money... your time... and the aggravation!
-
Peace,
-
PPN
-
-
PS: I have no affiliation with the makers of PowerPost 2000.

The fact that the interference occurs on discrete frequencies (Prime and regular harmonics) leads me to believe that it is the monitor. Try changing the refresh rate and you may verify this. I had the same problem and this was the cure.

From: "Greg D." <gregd@jps.net>
Message-ID: <tjpo5.10207$p5.400381@nntp1.onemain.com>
Source record: 11316

Ok, this sounds just like my situation... Here's what I've found:

P-III 667, Asus motherboard. The chassis is all metal, but it doesn't matter if the side panels are on or off! The noise is very broad band, but does peak frequently across the bands. It tapers off above 15 meters, but I can hear it even up into the VHF range.

It's not the monitor, and it's not the motherboard, CPU, video, sound, etc.
cards. It's the power supply!

I confirmed this by plugging the computer into a different circuit in the
house via an extension cord. Lower noise. Then I got a couple of line RFI filters (not surge supressors - they're for a different problem), and
that helped more, but going from S7 to S5 still leaves me with an S4 size
problem.

The previous computer was an old P90 system from HP, which was totally quiet. I also have a P200 clone in the same room (same wall plug too), and it's pretty quiet too, so it's not impossible to do this right.

It looks like I need to get a new power supply. ATX format, 250 watts. The current unit is from Transworld. Any suggestions for a good QUIET brand?

Greg.

Very good thought about the monitor. Another thing you might want to check out is the susceptibility of the antenna input. I have a Pentium II-233 laptop kissed right up to my old TS-140S. If there are any loose or less-than-perfect connections through the tuner, SWR bridge, coax jumpers, etc., the receiver just roars. If all the connections are made up correctly, it's quiet. I'm assuming you're not using something like an indoor antenna, or a very low, close antenna or an open feedline into the shack. If the antenna is far enough away not to pick up a majority of the noise, the rest of the system should be able to keep it out. You might also try some ferrite on the outside of the coax in various places to prevent noise currents from working their way to the antenna itself.

Some thoughts...

I had terrible power supply noise here; 80m was completely unusable.
The thing even whined audibly when switched off (stand by really).
I replaced it with another one from the clone shop and it's been fine.
Just lucky I guess. The new one seems to have variable fan speed,
which is an added bonus.

Hi,

I am exploring the application of a point to point radio link between two host computers for an academic project. Ultimately, I would like to write a Window NDIS driver to interface to a an RF modem via a RS-232C connection.

Does anyone have any experience in this area? Any suggestions as to whether its technically feasbile or not? Ultimately, for this acedemic project, I would like to take an existing UDP/IP application an run it over this radio link.

Any advice would be greatly helpful. I have look at a pair of RF modules by a Abacom and it seems to be feasible.

How about Amateur packet radio? From what I have read, it looks like with packet radio, you use a TNC to bridge the host computer and the radio. Is it possible to interface a VHF/UHF transceiver to a standard modem and write the NDIS driver on top of that? My understanding is that the standard analog modem would handle the digital RS232 interface and accompanying digital serial data and modulate it onto a typical carrier signal for transmission over POTS. Could you take that signal and route it to a VHF/UHF transceiver for transmission? If that even possible or is that just plain crazy?

Are there any other valid, feasible solutions? The ultimate goal of the project is to write the driver and hence the data link layer (handling all the error detection, flow control, etc) and ultimate provide solution to run this particular UDP/IP application over top of it.

As for data rates, I have read about numerous RF modems that claim they can achieve over the data rates of 38.4Kbps (in theory anyway) using GMSK and DFM. Any recommendations on hardware?

Do I still TNC if I am writing the NDIS driver?

Thanks in advance!!

Take a look at:

http://www.raag.org/sv2agw/

He has an NDIS driver, and many other solutions. The TCP/IP over radio part does have a charge, but it is less than a 6-pack of beer.

Also look at Linux and built-in IP and AX.25.

The AGWPE (packet engine) is also really neat for programming packet radio solutions using IP and sockets.

Very powerful Windows interface, and similar to the one included with Linux.

Has anyone used the MFJ 1278B/DSP multi-mode controller? I'm considering buying it, but would like to hear any users feedback, good or bad, before I decide.

I'm using an old PK-232 right now, but it's fading fast. I'm also thinking about the KAM-98 and the Timewave PK232/DSP.

Any input or comparisons on these units is appreciated!!

Thanks

Dave

Hi, I have been using one for a few years now and no major complaints.

Mostly use sound card RTTY and PSK31 now but the MFJ does quite nice
on Pactor. Just wish I could send small binary files using it on
WinLink2000. (Would be nice to send small .jpg files).

I hope this helps,

From: Greg and Joan <ggjn@sprynet.com>
Message-ID: <39A9AAA9.607D1CB5@sprynet.com>
Source record: 11341

I have a PK-232MBX. In moving the station from one place to another, I lost the cable (or don't know which one is which, in any event).

The documentation with it advises NOT to use a standard RS-232 cable, but use the one that is supplied with the PK-232MBX.

Now, I know AEA is out of business.

Is there a place I can pick up the special cable that came with the PK-232MBX?

Or is it possible to use a "standard cable" but cut some of the pins?

Thanks for your help in advance
Greg

Hello Greg,

If you are using a 25 to 25 cable, opnly 1 thru 8 and 20 should be connected.
If you are using a 25 to 9 cable, here are the connections:

RS232 9-Pin DIN

8.....1
3.....2
2.....3
20.....4
7.....5
6.....6
4.....7
5.....8
1..... No connection

http://www.timewave.com has complete details on repairs and upgrades, as well
as softwrae for the PK-232.

That's just the thing I'm trying to avoid. The local telco has a monopoly
and makes everything extremely expensive. I'd also like to get a 24/7
connection instead of a dial-up like ISDN. Staying connected with ISDN 24/7
over such a distance would be more expensive than getting a leased line.

Thanks

With one hop, do you mean 1 repeater? The topology between the points is a bit hilly. The other point is near the coast and so is at sea level. There is about a kilometer (0.65 miles) difference in height between the 2 points.

Isn't there any way of making sure if it's possible to do what I want? I'm in South Africa. Anyone know someone down here that does this sort of thing?

Thanks

3560. Help with Baycom BP-1 and HTX202

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-08-28 00:00:00 UTC
From: history67@aol.comTRASH
Message-ID: <20000828061738.25819.00001308@ng-cs1.aol.com>
Source record: 11344

Anyone have BP-1 to HTX202 tips? I have tried to connect my Baypac BP-1 to my HTX202 and Yaesu 530 but several attempts have failed to get it to transmit (the screen says it is transmitting, radio is not) I had no trouble getting it to transmit on the HTX212. I am using the pin out that Baypac suggests in its "hints" folder included in its software. (Yellow to mic center pin, red not attached) Speaker pinout is Green is center, balck is side.

Any one know what else might work???

I used a standard cable and broke off the pins. The manual tells you
which one's should not be connected. If you don't have a manual, I
could look it up for you.

Anyone know if the Icom CI-V protocol allows for setting TX and RX (ptt), especially in the older versions of the protocol (apparently 0x17 does this for the very latest rigs only).

None of my docs imply this can be done.

If so, what is the CMD, SUBCMD, etc.?

Depends on the geography ... hills in the way?

If there is a clear line of sight path available, then it can be done in one
hop, with some expensive gear, perhaps $1000 per end.

I suspect Gary will post details. This was discussed at length a few
months back.

Well now, if you want "non-low-budget" that's a different story.
Here is a web site that may be of interest.

Mobile Telesystems, Inc. at http://www.mti-usa.com/

They have systems that will handle up to 256 kpbs but the one
that might be of interest to you would be the TT-3080A, in the
"Products" section.

With radio equipment, your hourly/monthly fee to the telco will be replaced
by a huge one-time investment followed by possibly lower recurring costs for
electricity, maintenance etc. But the break-even point may be quite
distant in the future. Calculate it first.

Also, you may be under-estimating the technical difficulty. Radio amateurs
have not been able to deploy technology like you need on a wide scale.
Sure, it has been designed and it is working, but (comparatively) nobody is
using it. That should be a bit of warning.

Meant no repeaters. That antennas at each end could be seen well in
the clear from each other. If they can't, you will need repeaters placed
such that at each hop there is a visual path between the antennas.

Earth Curvature, Cost projection Thoughts:

You want a 150 mile radio link. Let's look at some of the engineering problems.
Since one station is 1000 metres higher than the other, this means the radio
range with Earth curvature is 81 miles.

Eq. 1 d = sqrt(17*h) Distance of the path in kilometres
Where h = 1000 metres
Then
d = 130 km or 81 miles.

Thus, 150 miles is out of the question unless you raise the antenna height.

Solving for h, we can re-arrange to:

sqrt(h) = [d / sqrt (17)]
Eq. 2 h = [(241 / 4.1231)]^2
h = 3417 metres - (1000 metres elev diff) or 7930 ft

You could split this between the two sites, and say have two 4000 ft antennas.

Most microwave links are 40 miles (64 kilometres). Plugging this into Equation
2,
we find that the antenna would have to be 791 feet high if both were at sea
level,
but since one station is 3280 feet higher than the other, you should be able to
use roof-top antennas given no obstructions.

To do what you desire, I would say, you need about 4 hops (the two ends, and
two repeaters in-between. You would need about 10 Watts per radio into a
microwave dish. 10 Watts in an in-line amp at 2.4 GHz is about $2k to $3k per
node, or about $8k to $12k USD.

Using a Spread Spectrum radio like the Proxim 7921, you can expect about 7
miles per hop, or about 21 hops (the two ends, and 19 repeaters). Each repeater
costs about $500 (radio, antenna, misc), or about $10k USD. Each repeater
has a 30 ms latency, or a path latency of 6.3 seconds (a packet leaving
your node would arrive about 6 seconds later at the end-node).

Looking at the above, I'd say that unless you are very wealthy, and have
money to blow (.com stock) you would be better off buying a sail boat and
a couple cases of beer. It would be infinitely more fun.

Yours Truly,

Jimmy

At that distance a VHF/UHF troposcatter link might be possible.
Troposcatter links have been used e.g. to provide telephone services
to North Sea oil rigs.

At 240 km distances the troposcatter path loss on VHF/UHF is less than
200 dB for about 99 % of the time. These are worldwide averages and
the loss can vary from region to region.

Maybe about -110 dBm of received signal is required to transfer 64
kbit/s. Antenna systems with multiple yagis at both sites may have a
gain of 20 dB on each site. The antennas must have a clear view of the
horizon (0 degree elevation), any local obstacles above 0 degree
elevation will increase the path loss by 10 dB for each degree.

With 100 W (+50 dBm) transmitter power, the received power would be
+50+20-200+20=-110 dBm or just sufficient for 64 kbit/s. The regional
phase loss variations can be large and there can be seasonal
variations also, so you may have to be prepared to use 1 kW
transmitter power or drop the speed to 9600 bit/s.

Ordinary FSK and PSK will suffer quite a lot distortion from
troposcatter propagation and this may require the use of some more
robust modulations, such as spread spectrum or COFDM.

If this is not an amateur radio application, then these sites needs to
be licensed, requiring frequency allocation and station inspections.

So neither is this a low budget alternative.

You might check for satellite based Internet operators if they provide
service in your region. Some require an ordinary phone line for
uplink, while at least some plan to have systems in which the user
also has a satellite uplink transmitter. However, this may require
special licensing arrangements in some countries.

If 9600 baud will be good enough, the no repeater solution
might work. Gear is much cheaper, on the order of $500 - $700
per end including antenna arrays, feedline, power supplies.

In this area the terrain is similar, with long valleys and high mountains.
We have several 9600 baud links that span 65 to 100 miles and
work very well. None at present that span more than 100 miles,
because the terrain prevents such links.

Hello, I am in need of a factory service manual, or a copy thereof; I have a 211 that is from 2.5KHz to as high as 19KHz higher than displayed frequency both TX and RX. When first powered up it is right on frequency then drifts the amount previously mentioned; however, once warmed up the drift stops and the unit is stable from there on.

If anyone out there can help it would be most gratefully received, please reply to sulch@gte.net

Thank you,
73s Chuck KG4ESR

Thanks very much to everyone who replied, especially to J. Hoffa and Paul Keinanen for your long and detailed replies. I won't be able to do what I wanted due to the technical difficulty and cost of such an operation.

As I've mentioned bandwidth down here is really expensive. There is a new service launching early next month that will be providing 2MB links at an unbelievably (for us) affordable price. The only problem is that this new service won't be available in the local town soon. I wanted to hire the service in the closest city and communicate with my equipment in that city.

Just for interest's sake, how much do 2.4GHz repeaters cost? And also, where can these usually be put? Do you hire space from somebody else's tower?

Thanks again everyone.
Sarel Botha

Make Money $$$ Work at home! Easy

EASY MONEY - NOT A SCAM! I found this on a bulletin board and decided to try it

A little while back, I was browsing through newsgroups, just like you are now, and came across an article similar to
this that said you could make thousands of dollars within weeks with only an initial investment of $6.00!

So I thought, "Yeah right, this must be a scam." But like most of us, I was curious, so I kept reading.
Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article.
You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it.

So after thinking it over, and talking to a few people first, I thought about trying it.
I figured, "What have I got to lose except 6 stamps and $6.00, right?"

Then I invested the measly $6.00. Well GUESS WHAT!?...
within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon,
but the money just kept coming in. In my first week, I made about $25.00.
By the end of the second week I had made a total of over $1,000.00!
In the third week I had over $10,000.00 and it's still growing.
This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly.
It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!!

Let me tell you how this works and most importantly, WHY it works...
Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it.
I promise you that if you follow the directions exactly, that you will start making more money
than you thought possible by doing something so easy!
Suggestion: Read this entire message carefully! (Print it out or download it.) Follow the simple directions
and watch the money come in! It's easy. It's legal And, your investment is only $6.00 (plus postage)
IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is 99% no risk
- it really works! If all of the following instructions are adhered to, you

will receive extraordinary dividends.

PLEASE NOTE: Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60
days. This program remains successful because of the honesty and integrity of the participants.
Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order
business. In this business your product is not solid and tangible, it's a service.
You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists.
However, the money made from the mailing lists is secondary to the income which is made from people like you and
asking to be included in that list. Here are the 4 easy steps to success.

STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper
"PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside EACH
of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery).
Next, place one paper in each of the 6 envelopes and seal them.
You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your :
name and address, and a $1.00 bill. What you are doing requesting a legitimate service and you are paying for it!
Like most of us I was a little skeptical and a little worried about the legal aspects of it all.
So I checked it out with the U.S. Post Office : (1-800-725-2161) and they confirmed that it is indeed legal.
Mail the 6 envelopes to the following addresses:

#1) K. Hurls, 3908 Ardmore St, Silver Springs, NV 89429
#2) R. Fowler, 60 Hemlock Haven, Hampton, NH 03842
#3) Sandra Scott 145 E. David Dr. Nashville IL 62263 #5) J. Little 12 Black Oak Ct. Reisterstown, MD21136
#4) GR. Casey, 22 Danelagh, Tamworth, Staffs. B79 8LR. England.
#6) Andreas de Br&#65533;cq Oredalen 101. 1612 Fredrikstad. Norway

STEP 2: Now take the #1 name off the list that you see above, move the other names up
(6 becomes 5, 5 becomes 4, etc.) and add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post
your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups)
All you need is 200, but remember, the more you post, the more money you make!
You won't get very much unless you post like crazy. :)

This is perfectly legal! If you have any doubts, refer to Title 18 Sec.1302 & 1341 of the Postal lottery laws.
Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again.

PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants
and by their carefully adhering to the directions. Look at it this way. If you are of integrity,
the program will continue and the money that so many others have received will come your way.

NOTE You may want to retain every name and address sent to you, either on a computer or hard copy and keep the
notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.)

So, as each post is downloaded and the directions carefully followed, six members will be reimbursed
for their participation as a List Developer with one dollar each. Your name will move up the list geometrically
so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!!
What an opportunity for only $6.00 ($1.00 for each of the first six people listed above)
Send it now, add your own name to the list and you're in business!

DIRECTIONS FOR HOW TO POST TO NEWSGROUPS
Step 1: You do not need to re-type this entire letter to do your own posting.
Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document,
and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory.
Step 2: Open a blank 'notepad' file and place your cursor at the top of the blank page.
From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list.
Step 3: Save your new notepad file as a .txt file. If you want to do your postings in different settings,
you'll always have this file to go back to.
Step 4: Use Netscape or Internet explorer and try searching for various newsgroups
(on-line forums, message boards, chat sites, discussions.)
Step 5 Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting
paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings
in a particular group, click the post message button. You're done with your first one! Congratulations...THAT'S IT!

All you have to do is jump to different newsgroups and post away, after you get the hang of it,
it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU HAVE TO POST A MINIMUM OF 200 That's it!

You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box
due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use,
as long as the : postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**

Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings,
each with my name at #5 and only 5 persons respond to each of the original 5, that is another
$25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each,
I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200
with my name at #3 and only receive 5 replies each, I will make an additional $625.00!
OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they
each only receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to
200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625,00!
With an original investment of only $6.00! AMAZING! When your name is no longer on the list,
you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting
your name at number 6 again. And start posting again.

The thing to remember is do you realize that thousands of people all over the world are joining the Internet
and reading these articles everyday? JUST LIKE YOU are now!!
So, can you afford $6.00 and see if it really works?? I think so... People have said,
"what if the plan is played out and no one sends you the money? So what! What are the chances of that happening
when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday
and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those
joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will really work!!!

Make Money $$$ Work at home! Easy

EASY MONEY - NOT A SCAM! I found this on a bulletin board and decided to try it

A little while back, I was browsing through newsgroups, just like you are now, and came across an article similar to

your name at number 6 again. And start posting again.

The thing to remember is do you realize that thousands of people all over the world are joining the Internet
and reading these articles everyday? JUST LIKE YOU are now!!
So, can you afford $6.00 and see if it really works?? I think so... People have said,
"what if the plan is played out and no one sends you the money? So what! What are the chances of that happening
when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday
and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those
joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will really work!!!

Make Money $$$ Work at home! Easy

EASY MONEY - NOT A SCAM! I found this on a bulletin board and decided to try it

A little while back, I was browsing through newsgroups, just like you are now, and came across an article similar to
this that said you could make thousands of dollars within weeks with only an initial investment of $6.00!

So I thought, "Yeah right, this must be a scam." But like most of us, I was curious, so I kept reading.
Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article.
You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it.

So after thinking it over, and talking to a few people first, I thought about trying it.
I figured, "What have I got to lose except 6 stamps and $6.00, right?"

Then I invested the measly $6.00. Well GUESS WHAT!?...
within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon,
but the money just kept coming in. In my first week, I made about $25.00.
By the end of the second week I had made a total of over $1,000.00!
In the third week I had over $10,000.00 and it's still growing.
This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly.
It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!!

Let me tell you how this works and most importantly, WHY it works...
Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it.
I promise you that if you follow the directions exactly, that you will start making more money
than you thought possible by doing something so easy!
Suggestion: Read this entire message carefully! (Print it out or download it.) Follow the simple directions
and watch the money come in! It's easy. It's legal And, your investment is only $6.00 (plus postage)
IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is 99% no risk
- it really works! If all of the following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE: Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60
days. This program remains successful because of the honesty and integrity of the participants.
Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order
business. In this business your product is not solid and tangible, it's a service.
You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists.
However, the money made from the mailing lists is secondary to the income which is made from people like you and
asking to be included in that list. Here are the 4 easy steps to success.

STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper
"PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside EACH
of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery).
Next, place one paper in each of the 6 envelopes and seal them.
You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your :
name and address, and a $1.00 bill. What you are doing is requesting a legitimate service and you are paying for it!
Like most of us I was a little skeptical and a little worried about the legal aspects of it all.
So I checked it out with the U.S. Post Office : (1-800-725-2161) and they confirmed that it is indeed legal.
Mail the 6 envelopes to the following addresses:

#1)K. Hurls, 3908 Ardmore St, Silver Springs, NV 89429
#2) R. Fowler, 60 Hemlock Haven, Hampton, NH 03842
#3) Sandra Scott 145 E. David Dr. Nashville IL 62263
#4) J. Little 12 BlackOak Ct. Reisterstown, MD21136
#5)GR. Casey, 22 Danelagh, Tamworth, Staffs. B79 8LR. England.
#6)C. Sovey, 2888 Kinde Rd. Kinde, MI 48445

STEP 2: Now take the #1 name off the list that you see above, move the other names up
(6 becomes 5, 5 becomes 4, etc.) and add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post
your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups)
All you need is 200, but remember, the more you post, the more money you make!
You won't get very much unless you post like crazy. :)

This is perfectly legal! If you have any doubts, refer to Title 18 Sec.1302 & 1341 of the Postal lottery laws.
Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again.

PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants
and by their carefully adhering to the directions. Look at it this way. If you are of integrity,
the program will continue and the money that so many others have received will come your way.

NOTE You may want to retain every name and address sent to you, either on a computer or hard copy and keep the
notes people send you. This VERIFIES that you are truly providing a service.
(Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.)

So, as each post is downloaded and the directions carefully followed, six members will be reimbursed
for their participation as a List Developer with one dollar each. Your name will move up the list geometrically
so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!!
What an opportunity for only $6.00 ($1.00 for each of the first six people listed above)
Send it now, add your own name to the list and you're in business!

DIRECTIONS FOR HOW TO POST TO NEWSGROUPS
Step 1: You do not need to re-type this entire letter to do your own posting.
Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document,
and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory.
Step 2: Open a blank 'notepad' file and place your cursor at the top of the blank page.
From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list.
Step 3: Save your new notepad file as a .txt file. If you want to do your postings in different settings,
you'll always have this file to go back to.
Step 4: Use Netscape or Internet explorer and try searching for various newsgroups
(on-line forums, message boards, chat sites, discussions.)
Step 5 Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting
paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings
in a particular group, click the post message button. You're done with your first one! Congratulations...THAT'S IT!

All you have to do is jump to different newsgroups and post away, after you get the hang of it,
it will take about 30 seconds for each newsgroup!

**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!
BUT YOU HAVE TO POST A MINIMUM OF 200** That's it!

You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box
due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use,
as long as the : postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**

Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings,
each with my name at #5 and only 5 persons respond to each of the original 5, that is another
$25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4

and only 5 replies each,
I will bring in an additional $125.00! Now, those 125 persons turn around
and post the MINIMUM 200
with my name at #3 and only receive 5 replies each, I will make an
additional $625.00!
OK, now here is the fun part, each of those 625 persons post a MINIMUM 200
letters with my name at #2 and they
each only receive 5 replies, that just made me $3,125.00!!! Those 3,125
persons will all deliver this message to
200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups
react I will receive $15,625,00!
With an original investment of only $6.00! AMAZING! When your name is no
longer on the list,
you just take the latest posting in the newsgroups, and send out another
$6.00 to names on the list, putting
your name at number 6 again. And start posting again.

The thing to remember is do you realize that thousands of people all over
the world are joining the Internet
and reading these articles everyday? JUST LIKE YOU are now!!
So, can you afford $6.00 and see if it really works?? I think so... People
have said,
"what if the plan is played out and no one sends you the money? So what!
What are the chances of that happening
when there are tons of new honest users and new honest people who are
joining the internet and newsgroups everyday
and are willing to give it a try? Estimates are at 20,000 to 50,000 new
users, every day, with thousands of those
joining the actual Internet. Remember, play FAIRLY and HONESTLY and this
will really work!!!

3587. ANNOUNCE: APRS Protocol Specification Version 1.0

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-08-31 15:20:01 UTC
From: Ian Wade <ian.wade@netro.co.uk>
Message-ID: <R9FH+cBhenr5Ew1z@netro.co.uk>
Source record: 11274
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

I'm happy (you don't know *how* happy) to announce that APRS Protocol Specification Version 1.0 was approved by the APRS Working Group on August 29, 2000 and has been made available for download at the Working Group web page, http://www.tapr.org/tapr/html/Faprswg.html.

This Version 1.0 (technically, due to change control, version 1.0.1) document is nearly 130 pages long and does a tremendous job documenting the APRS protocol as used on the air in the summer of 2000. We should all thank the Working Group members, and especially Ian Wade, G3NRW, the Technical Editor who actually wrote the thing, for their hard work. Although the process took far longer than anyone anticipated when we started, I think the end result is definitely worth the wait.

Where do we go from here? Although this is an excellent document, it almost certainly still contains errors, omissions, and ambiguities. In addition, it reflects only the current protocol, and not any of the areas in which the protocol might be extended. The WG members will be meeting at the DCC in Orlando next month and electronically thereafter to put in place a mechanism to deal with requested corrections and enhancements. The WG Charter outlines a way to handle this, but experience has shown that some modifications may be necessary for a workable process.

Also at the DCC and thereafter, the WG will consider adding new members. Since its founding, several new authors have come on the scene, and two of the original members have resigned. Any author of software or firmware implementing the APRS protocol who wishes to join the WG should contact me (jra@febo.com or n8ur@tapr.org) directly. Please -- we need to hear directly from those interested in joining, so rather than writing to ask that someone be considered, encourage that person to get in touch with me. Also, please remember that the WG is not affiliated with TAPR. Membership decisions will be made by the group, and I can't tell you now how many (if any) new members will be added.

73,
John Ackermann N8UR
Administrative Chair, APRS Working Group

Hi there, I have the following ex pmr equipment for sale:

2 X KEY KM450 UHF - Unconverted £40 Each

Motorola M110's, 2 channel UHF mobiles, programmed to 70cms if required.
Require external speaker for audio.
Supplied with Mic + Speaker £45
Supplied without Mic + Speaker (radio only) £30

Kenwood handportables UHF
6 X TK-350
6 X TK-340
3 X Speaker Mic's
6 Chargers
Kenwood equipment unprogrammed and open to offers.

Have you taken a look at the pinouts at www.packetradio.com?

If you can find one, the kantronics KPC3+ manuals have good info as well.

Describing the BP-1 conductors by the colors if of no use to anyone who may try
to help. Give us their purpose: PTT, audio out, audio in, etc.

I run 2 HTX-202s here, both on KPC3+'s. Work great!

It is becoming more and more clear that you aren't looking for AMATEUR
radio at all. You are in the wrong group.

As amateur radio enthousiasts, we normally are not looking for a cheap
replacement for a leased line, but we are interested in experimenting with
radio. With that motivation and a lot of lobbying, we often get telco
tower space for free.
When you are just after cutting under the telco's own rates, they probably
won't be that considerate.

I ordered the BP2-M today from Tigertronics as an upgrade to my BP-1 which I have had years of success with on Packet.

I noticed as one of the features of the BP2-M is SSTV. I have read over the years about Slow Scan but never felt ready to make the plunge into it.

Has anyone used the BP2-M for SSTV and what kind of results have u had?

Thanks in advance.

3596. MURS potential

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-01 18:41:57 UTC
From: horseshoestew@my-deja.com
Message-ID: <8oot9g$6qs$1@nnrp1.deja.com>
Source record: 11284
Cross-posted to: rec.radio.amateur.digital.misc,alt.radio.family,rec.radio.amateur.policy

At first glance it would appear that the 2W ERP limit for MURS is "crippling".

However, if someone mounted a "moderate" gain antenna at a decent height, through good coax, from a 1W transmitter - he wouldn't be exceeding the ERP limit by very much, if at all, but would have excellent coverage.

On GMRS you can use 5W ERP. But, unfortunately, with GMRS you can't transmit data.

There is obviously much more chance for users to attempt to exceed the ERP limitations(especially if they don't exceed it by much) than there is for them to attempt to skirt the emission type limitations(a "yes or no" proposition - there is no grey area). So, there is no doubt that MURS offers more potential than GMRS, and there is a potential impact to Amateur Technician Class growth.

Now, let's look at digital modes. I think that this is where MURS offers the most potential. The lack of repeaters is actually a benefit for digital modes(as the use of dedicated repeaters for packet are extremely rare). Also, there is a renewed chance to try to build a 9600bps network on VHF. In the 80's, there was massive growth of the 1200bps Amateur packet network. There actually was a time when Hams were using 1200bps, when most telephone modem users were at 300bps. But the 1200bps standard soon became an anchor around the neck of Amateur packet radio. In the 90's, as telephone modem users saw their communications rates climb to 2400, 4800, 9600, 14.4, 28.8, and then to 56kbps - the hams were STILL slugging along at 1200bps. In 1990 2400bps packet was easily achievable, but everyone had standardized on 1200bps - besides, everyone felt that 9600bps was just around the corner. However, by this time, the majority of hams had become "appliance operators", and were not capable of the effort that was needed to build a non "plug-and-play" system(which 9600bps systems generally were at the time). This was not helped by the major radio manufacturers, who had a difficult time producing a true 9600bps-capable radio. Today, however, the story is changing. It is much easier to build a 9600-bps capable station.

I wonder if the 9600bps-capable Kenwood TH-D7A(with builtin TNC) can be modified to operate on the MURS channels(150Mhz)?

BTW, with the 2W ERP limitation, and no repeaters, the 5 channel limitation also sounds worse than it actually is. Besides, very few people are using any the Amateur 2m channels, at least here in Southern

California. There are a few busy repeaters, but that is it. The rest of the channels are "dedicated" to silent, unused repeaters. Albiet, there is one channel dedicated to 1200bps 2m APRS use that is well utilized; but the few other channels where packet activity is seen, are just filled by hi-level nodes incessantly "blabbering" to each other at 1200bps - filling the channel bandwidth, while not performing any useful function. At least at 9600bps, it is possible to use TCP/IP, and get away from THAT nonsense.

Why would a technically capable person opt for 5 discrete CHANNELS
and a limitation of 2W under MURS, when the Technician license
allows 1500W and literally hundreds of available MEGAHERTZ of to
build out their data, voice, or image network? Your notion
of "potential impact" to Amateur Radio disappears under the simplest
reality-check.

> I wonder if the 9600bps-capable Kenwood TH-D7A(with builtin

The modification would be easy, but it would be illegal to use
on MURS.

Because they wouldn't be hamstrung by the Amateur limiations on
performing business, or freely accessing the Internet. Those are HUGE
advantages.

There are quite a few of the digitally-oriented hams out there that
take the position that most ANY ham Internet access is "verboten",
because it is so commercialized.

I'm sure it will be a slam-dunk for Kenwood to produce a MURS-specific
TH-D7A, and get it FCC type accepted. Radio Shack and Motorola won't
be far behind.

2400 Baud for telephone modems was in place well before 1990.

What "5 channel limitation?" The DX-cluster channels are also quite active,
and if 9600 baud were really in use, the ONE frequency that is allocated to it
would not be idle 99% of the time. Also, the net/rom node interchanges are
less than 50% of the traffic on the bands - there are BBS users and other
things happening too.

If you want to justify a spectrum grab on 2m for digital, the existing digital
allocations had better be utilized at more than "full capacity" (meaning that
INTERACTIVE stations [as in a real person is there] have problems communicating
because of collisions with other interactive stations passing traffic 80%+ of
the time).

Consider also that there are several frequencies in the other bands (notably
70cm and 23cm; maybe 6m) which aren't reserved for specific uses yet.

The price of these FRS radios is what draws many to them.

The fact that they are better than the 6 meter and 11 meter
old days talkies gives them added value.

But once you've seen power and antennas, those products
seem silly to use outside their intended market.

Buy one, they are fun, and are great for families with kids,
for vacations, and many other uses. Using them outside
their design market is both illegal, and without technical merit.

Jimmy

If you don't like it - cry to the FCC. I doubt if you'll have any luck going up against Radio Shack and Motorola. As for me - I'm looking at ways to take advantage of it.

I thought you were talking about the amateur channels on 2m - as 145.01-.09 - 5 consecutive digital channels. Mentioning how "quiet" the amateur allocation is threw me ... and if it is so quiet where you are, then why do you need to get away from it all by using another [proposed] service?

When one writes a paragraph, a reader usually expects the text to follow a logical flow and not be a non-sequitur.

MURS is not a reality until it is actually enacted. For now, it's just a proposal.

1) Why do I need to cry to the FCC about an underutilized allocation that IS available to me? I would simply use it if I had a need.

2) Why do I need to justify the design and sale of equipment destined for use on a set of frequencies that had no legal or licensed users? Their design and sale irregularities are their problem, not mine.

3609. Software Updates PSK etc

Hi all.

You may or not be aware that I carry most current psk etc softwares on the download page of my site, and the following software's have been updated.

Logger by Bob K4CY is now in version 7.09

Zakanaka is a special case as it is in Beta testing format, and now upto Beta 16.

MixW32 by Nick UT2UZ is now in version 1.43 (Registered, and Demo)

Apart from the Beta16, the above are on my download page.

http://www.btinternet.com/~g3vfp/download.html

Best Regards,

Hello,

As a user of the HOKA Code 3 Gold software I was recently looking for the mailing list that was hosted at grove.net.

As it seems that this is no longer around (my findings - I may be wrong!) I decided to dedicate some space on my web server to a Hoka Code 3 Forum.

If anybody would like to contribute to this forum it is located at:

http://www.oseu.co.uk/cgi-bin/Ultimate.cgi

This is the forums temporary location until I upload the new web pages. All registered users will be informed of the new URL once the work has been carried out.

Apologies for the cross posting, but I have only posted to the news-groups that I think would have some interest in the Hoka Decoder.

Regards

Richard Clafton

Your theory is incorrect.

We have a cell-based packet radio network
here, with overlaid small / medium / large cell sizes.

You used to have such a thing in Southern California.
Isn't it there anymore?

MURS is not a cell based system. It is a technologically simplistic point-to-point channelized system, several technology-generations inferior to amateur radio. I thought you were the fella hyping what "technically aware" would do if you could just find a few 12-year-olds to help you out.

It appears that the command-line-capable version of WinLink is being
phased out. The new version requires the use of specific software, (WL2K)
and does not appear to work with anything else. The WinLink team may,
according to the latest information on some of the web sites, add the
command-line capability back into the software in some future release.

If you want to pay for the service, there are commercial AirMail
providers that might do what you need.

Hmmm ... urls didn't get into my first reply.
Here are some places to look for commercial services.

http://www.pinoak.com/

http://www.downwindmarine.com/sailmail/sailmail.html

A Google search for "AirMail", "SailMail", "PTC-II", "WinLink" and
various other keywords will provide a lot of information on what is
out there, and how it is evolving from the Ham Radio test/development
mode into commercial use.

> You used to have such a thing in Southern California.
> Isn't it there anymore?

I was shocked when I recently went to LA! There is no Ham
activity at all! I finally picked a repeater and stated my call, and
waited for a response. It just morse code ID'd and that was it.

Hmm, try another one. "You probably don't know, but this is a
private repeater." OK, sorry, try another one. "Hey buddy, are
you new in town? Any idiot would know this repeater is private."
Oh, sorry, tried another 5 and got morse-code and voice ID's.

Got on 146.52 and stated my call. waited 5 minutes and stated it
again. "Hey mutha-fucka, stoopid shit, we don't want to rap
whiff none oh dat white trash fum back east."

Silence. Nothing else heard in a half-hour scan.

Hmm, must be a baseball game in town or something...

Time for the FCC to take all that wasted spectrum back to
"we the people..."

Using TCP/IP as the communication protocol, and "cell" hubs connected to Internet thru cable modems/DSL connections - there is no reason a "cell"-based system can't be made to work.

One of the biggest problems with the 2m Amateur packet systems was(and still is) the existance of high-powered, wide-coverage "high-level" nodes. With one of them on a channel - it basically becomes unusable. In the Los Angeles area; 145.01, 145.03, 145.05 are perfect examples of this(K6VE seems to be the biggest blow-hard). At times these "blabber-mouths" even affect San Diego and Riverside/San Bernardino Counties. The 2W ERP and repeater limitations actually assist the "cell" technique - they do NOT "cripple" it.

> I thought you were the fella hyping

Why not. All most hams know how to do is argue, criticize, block progress, and put up old-fashioned high-power jamming stations - so that they can be king-of-the-channel. Building functional communication networks seems to be one their lowest priorities.

The protocol makes no difference at all. You have to build the RF part of
the network correctly before you can run ANY protocol over it!
Why this focus on using wires instead of radio? Why not connect
the cells together using radio links?

Please read past comments about cell based ham radio networks.
You need to hook the cells together, using super-cells, and hook
the super-cells together, etc. This is well-known technology, just
not used by the cell phone people (because they use wires to connect
the lowest level cells together). What you described is simply a network
topology designed by someone who has not paid attention to work
done in the ham radio networks 15 years ago. It ain't hard to build
WORKING wide area ham radio nets. But you do have to think
about how you will create small cells, and then how you will create
large cells to hook the small cells together, and then how you will
trunk those large cells together from city to city.

You mentioned only 2M frequencies.

Your solution seems to be "I don't know how to figure this out,
so I'll just punt and use the telephone company instead."
There IS much better (RF based) technology available. No, I don't
mean commercial frequencies, or anything like that. I mean reasonable
network topologies instead of the junk you described above.

Oh bull. Hams know how to build network, and have proved it in Europe,
and in some parts of the US. The "Gee, let's just use wires instead of
wireless."
folks sure make a real mess of things! Pure laziness in my view.

The reason why K6VE is there is because he is the ONLY ONE LEFT who is holding things together. Remove his system and the entire packet network for Southern California dissolves. (Also, K6VE's system is not on ALL THREE of those channels.) As for his ERP, his station's location, being AT HIS HOUSE on Mount Wilson, will virtually guarentee an effective ERP greater than 2W, unless someone forces him to use a milliwatt radio (most amateur equipment comes with 1W min. [HT's] or 5W min. [Moblies] in that frequency range). Try working with him, not against him, and see where that gets you.

As Hank Oredson says in a different response, just how do you expect to "glue" your cells together without some sort of backbone or meta-cell?

Also, what's the deal with using just 2m? You treat it as if there are no other digital amateur radio allocations whatsoever.

I will admit, you're not the only one with the 2m problem. There are allocations reserved for the DX-packetcluster operations on 6m and 223 MHz that go unused by them, yet the SCDXC still insists on using only 2m, including many simplex frequencies beyond those reserved for them. This angers many people,

especially those who are trying to use those [non-reserved 2m] simplex
frequencies for VOICE (for which the bandplan says they are).

...And speaking of that, just why haven't you voiced your opinion before one of
the Southern California digital amateur radio organizations? Instead of
complaining about it, do something about it.

I forward with K6VE, KM6RZ and N6IYA in California (40M, CLOVER).
Without those folks, and a very few others, the entire California network
would be totally dependent on the internet for it's connectivity.

And instead of complaining about those "crowded channels", put some
radios on air on some other frequencies.

> That's 25.6 Mbps total bandwidth required of the ham radio links.
> However the ham radio system connects into the internet must
> supply this bandwidth. How could that be done? Who would pay?

yes, I am suggesting higher speeds than are available via modem. We would use the same cost structure as an ISP in that you purchase bandwidth in bulk and then oversell that bandwidth. Think of it as buying shares in a T1. At any given moment how much bandwidth you get is not guaranteed but can range from nothing to the full pipe. Part of the appropriate use contract would be the ability to deny bandwidth pigs or at least charged them more for using more data.

To use your example of 100 users in the community, the end-user link would be 256 kilobits per second. Guaranteeing them the full bandwidth all the time would be very expensive proposition. However, if you purchase a T1, you can oversell a 256 kbps chunk of bandwidth 25 times which is a reasonable oversell factor for high-speed service. This means, at worst you would get 10.24 kbits per second which is slower than a modem but the condition would not persist. It's also possible to give people sufficient information so they can judge whether or not to even try.

Yet another option for dealing with bandwidth issues is to put a cap on any given user's bandwidth during peakload but this is to be rather messy. I personally prefer more "personal" persuasion methods. ;-)

we already have a model for paying for a shared resource. How do ham repeaters keep operating? By volunteer labor and by club members paying dues for the service. The same would be true for a community access Internet service. It would take volunteer effort as well as club members paying into the communal pot.

At this point, I expect some naysayers to raise the "tragedy of the Commons" issue. It would be possible to develop an authentication protocol which uses various ecash protocols to "pay-as-you-go" for the bandwidth. It would allow you to pay for the bandwidth use so that bandwidth pigs would be charged more.

Like a repeater club, if the members don't participate, the network will fall apart. It's probably a kinder death than the ones I have

seen in the corporate world when an organization should just close the door and turn out the lights instead of struggling to keep going.

I would expect also using a mixture of ham and part 15 equipment. I think hams would do best at providing backbone type services with part 15 equipment used for the last 200 feet. Proxim FHSS cards are reasonably cheap ($130 retail).

it all depends on your definition of "low bit rate". Anything under
megabit is, by my definition, noise. I look at megabit radios as
being low bit rate.

> > It would be good PR.

that's the way it is but is not the way it has to be. There are
several radio clubs my region (PARC, BARS, MMRA to name a few) but I
don't go to the meetings. Heck, even in clubs I am active in, I don't
go to meetings. granted I'm a poor example, but I believe that it is
possible to change that behavior and demographic.

> > It would attract technical people into the hobby.

well actually, it was his screwing someone else that got me where I am
today. Although, he did have an ugly tower in the backyard which was
used for a wind generator back before they were "popular".

I think I fit the definition of an aging, overweight white man with an
ugly tower in the backyard play with low-tech radios (and some
high-tech radios) better.

In the usual sense, he has a great location - but for the cell concept, he has a bad location.

MURS is kinda on 2m(~156Mhz), and that is the only personal service that allows digital AND business comms.

However, I've got both 2m and 70cm amateur radios(lots of 'em), and a bunch of UHF-based FRS/GMRS stuff too. In general, I prefer the propagation characteristics and reduced feedline loss of VHF vs. UHF. The main reason that I even started using 70cm was because 439.025 was/is the defacto 9k6 standard channel is SoCal.

Actually, it really isn't a complaint, but an observation that high-level nodes are a drawback when it comes to backboned systems.

I'm pushing for a medium-speed(~9k6)public wireless voice/data network using the Internet as the backbone. The fact that amateurs can't do business communications is a major drawback in establishing such a network on ham frequencies. I'm just pointing out that, because MURS offers both business AND digital applications, and is limited to low power(but not too low) with no repeaters - it is a better choice than ARS for establishing such a network.

Now that MURS is going to become a reality, you KNOW that Radio Shack, Motorola, et. al. are working on something like I'm talking about. Hams could actually "beat 'em to the punch" by moving their 9k6 stuff over and "staking a claim".

Modified Part 15 devices on 2.4Ghz sounds cool - but there is that little problem with "no business" communications that throws a wet blanket on things. Besides, feedline loss is a "killa" on 2.4Ghz, and the scuttlebutt is that propagation characteristics are less than desirable.

You have a cite for that number? I think it is way off the mark for
current internet users. That's 100 users "active online" not "100
users signed up for the service".

Perhaps you should remove rec.radio.amateur.digital.misc from
your crossposting, since this is simply not something that can be
done using ham radio. It is a commercial service you are talking
about. Has nothing much to do with this newsgroup.

Totally wrong.
He has a perfect location for a top level cell, which connects super-cells,
which then connect local cells. (Assuming you architect with three layers
of cells, as has been done in the successful ham radio networks.)

So what? This is alt.radio.amateur.digital.misc. MURS is off topic.
You want to go commercial, there are *tons* of different frequencies
available, in *many* different bands. Build whatever you want, or
lease it. No big deal.

> However, I've got both 2m and 70cm amateur radios(lots of 'em), and a

"... the ... channel ..." ???
Only one cell for all of Southern California?

No wonder it doesn't work!

Um ... "high-level" (by which I assume you mean "wide coverage"
and not "high-ERP") *are* the backbones. Duh ...

> I'm pushing for a medium-speed(~9k6)public wireless voice/data network
> using the Internet as the backbone.

Why do you persist in avoiding RF solutions?

There is *no* radio networking involved at all. It's just one little
tit off the internet serving one or a few users. Trivial. Old stuff.

First done over ham radio in 1984 for heavens sake!

What you suggest is simply totally trivial. You hang a TNC and radio
on your computer. Load your choice of *NOS software. Finished.

I have some spare radios and TNCs. Let's try it.

The whole task took me about ten minutes to accomplish on the
computer in the other room. Now it links that computer to the
internet over a 9k6 link on 424.750 to this computer.
Whew! That was hard! Oh neat! I can browse web sites via radio!
(The radios are TEKKs running 2W into dummy loads.)

If you want to build a commercial network, do so.
It's off topic for this newsgroup.

Hello
Take a look at
http://members.aol.com/chramade/dxpsk.htm
DXPSK v1.5a is now available for download FREE
New features :
25 seconds rewind capability
Adjustable audio width for the waterfall and the spectrum display
100Hz left or right (up/down) frequency shift
updated help file

3629. Digipan 1.2 Tx/Rx switching

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-07 10:40:57 UTC

Message-ID: <001001c018b7$78a5fdc0$017a3eca@co.nz>
Source record: 11217

Can anybody give info on the possibility of reducing the delay when switching from Tx to Rx on Digipan 1.2. From Rx to Tx is no problem but Tx to Rx is slow and if any other macro or whatever is attempted before changeover is completed, various oddities may occur. If the delay is necessary, why so.
Cheers from 3D2BA.

Ahhh... but you have to *pay* for a license, and the radios aren't
cheap, and there aren't common nationwide frequencies, and you would
have the problem of high-power high-level nodes...

... and how do you figure it is off-topic? This is a good segue - no
MURS newsgroup exists yet. I'm not even sure that the FCC report and
order is final, as there is very little information available on it at
the FCC site. My guess is that Radio Shack, Motorola, and company,
want to keep this thing under wraps - so that they can get a leg up on
the competition. I'm trying to tell people about it so that they
can "stake their claims".

NOS? More medieval technology. Just run straight TCP/IP.

EXACTLY! And now that you can't bitch about the *commercial* content -
because it is MURS and not ARS; you try to say it is "off-topic".

Handheld voice/data wireless communications is the RAGE right now.
This is "where its at", as far as radio is concerned.

This newsgroup is about amateur radio.
MURS has nothing at all to do with amateur radio.

Explain.

How is *NOS (you forgot the '*') different than any other
tcp/ip stack? Do you even know what you're talking about?

424.750 is an amateur frequency. You can drop the MURS obsession.

> users signed up for the service".

No cites because it is empirical. You oversell bandwidth until people start
to complain then you add a little more bandwidth. Publicized oversell
ratios are frequently lies. In the dial-up ISP world, small
pops oversell at a 10 to 1 ratio. very large-scale pops (2000
modems+) oversell at close to 30 to 1. The math behind this is based
on queuing theory.

the world gets different when you're talking about ethernet type
competition for bandwidth versus competition for a phone line. You
can use very high oversell rates because traffic tends to be bursty
and you can interleave on a time basis to achieve overall higher
utilization of the channel.

> Perhaps you should remove rec.radio.amateur.digital.misc from
> your crossposting, since this is simply not something that can be
> done using ham radio. It is a commercial service you are talking
> about. Has nothing much to do with this newsgroup.

let me bring things back to the original point. I argued that amateur
radio should be able to provide/carry traffic for community access
Internet. In theory, one should be able to do with a commercial
service but you can't in practice. There are no licenses left for
deploying such a wireless service. All of the big players are sitting
on the LMDS/MMDS licenses until they can figure out how to deploy a
service that will generate them billions of dollars to pay the
overinflated auction based license fees.

because the FCC lets licensees play "dog in the manger", there is
significant pressure to dig up more spectrum. Guess where is going to

come from? within the next five to ten years, I believe amateur radio will lose most of the spectrum above 440 to commercial interests. The only way to stop it is to occupy it. Converting more taxi radios and filling the bands with idle repeaters isn't going to help.

I want to keep amateur radio around for a while and doing interesting things even if it means slitting the throats of a few sacred cows.

this means thinking outside of traditional roles and operations such as providing datacomms for underserved/not profitable communities (ie rural and 2/3ed tier cities, university researchers, poor schools etc.)

I'm asking you to not just think out side the box but to punch holes in the side and climb out.

ABSOLUTELY.

> etc.)

That will help - but I think the big "killer application" is instant
handheld access to e-mail/newsgroups - even web pages(Motorola and RS
know this). While I'd like to see amateurs allowed more freedom to
access commercial Internet sites - I don't see how to make sense out of
it, not with the way Hams banter about things. It is better to just
allow free access in another service. MURS is the first service that
fits the bill(albiet with only 5 frequencies). Near 2m, it is on a
fairly reasonable frequency(above 300Mhz, you start to get a lot of
feedline loss), and the 2W ERP limit is totally reasonable for a
Internet-backboned network. And, best of all, there can be no debate
over "commercial" Internet access.

> I'm asking you to not just think out side the box but to punch holes
> in the side and climb out.

I am also irked by the "unused/underused" repeater syndrome. There is so much more Amateurs could be doing there. With respect to digital usage, I've been trying to get Amateurs to think differently for a few months now. Maybe it is just the "vocal minority", but my take is that, in general, veteran amateurs and the ARRL always opt for the status quo. It aint worth fighting with them over this stuff. For example, when presented with reasonable options to the old outdated Morse Code requirements, they would NEVER compromise. Belatedly, and much to their consternation - the FCC finally did something about it and lowered the old 5/13/20wpm reqs to 5wpm across the board. Of course, the "end-of-the-world" predictions about the second coming of CB weren't true - but they will NEVER admit that either.

For the most part, I think most of the veteran amateurs don't care that much about their VHF/UHF allocations. Once all the possible dedicated repeater frequecy pairs were "staked out", and any attempts to get allocations for digital applications were "snuffed" - the "battle" was over, and all their excitement went out the window. Other than a few well-maintained good-coverage repeaters, 2m/1.25m/70cm/33cm/23cm/13cm are wastelands. Like the Morse Code fight, the "old boys" ended up winning a battle - but also like the Morse Code fight, they will "lose big-time" in the end. I am thru trying to fight these fools - I would RATHER have the VHF/UHF amateur frequencies put to good use, such as they are in the other succesful free/nearly free public services such FRS/GMRS, and hopefully MURS. The FCC learned their lesson with CB (stay away from skip, and insure manufacturers don't produce radios/equipment that allows jamming/harranging to be easily acheived), and in recent years they seem to be doing things right with respect to the public radio services. If MURS shows that it can work out, then I expect to see some portion of the virtually unused VHF/UHF Amateur spectrum be converted to free public services(I would fight attempts to auction it off), where it can be put to good use. A conversion of 50% of the VHF/UHF frequency allocation sounds like a good starting number.

It's NOT the only 9k6 channel in 70cm. 438.950 - 439.075 (in .25 steps) are all 9k6. There are also a handful of 9k6 allocations at 431 MHz. If you prefer 2m, then why didn't you go with 9k6 on 144.99 MHz?

Modified part15 devices on 2.4GHz usuallyjam legitimate, WELL-DESIGNED amateur operations on 2.4. Right now, I've got an interference issue up there with a neighbor's 2.4 cordless phone that has yet to be resolved.

Also, if you don't want the LA County Sheriff's conditional permit to become permanent, you should advocate PROPER amateur use of the band. Most 2.4

equipment made under part 15 are a bit too wide banded for proper use.

[2.4 lan stuff will go outside of our band. 2.4 cordless phones sometimes suck up an entire MHz - too wide. Many problems with conversions.....]

>tons of mindless crud snipped<

Yah yah, blah blah... I've heard a goodly number of geekoids, over the years, sing the same old tired song about how stupid Hams are, how stupid the ARRL is, etc etc etc.. How we ought to use the high bands more, blah blah blah.

(Yawn)

Not one of them ever DID anything useful, not even to further thier own alleged "cause"... But they sure are good at carping about everyone ELSE!

Ignorant jerks. After hearing this same old tired crud for so many years, followed up by ZIP, by way of action along the lines they allegedly propose, I've come to the conclusion that this particular brand of blowhard is only there to SPAM legitimate discussion of Ham radio issues, and attempt to drag Hams down to their own sorry level. Many of the loudest ones work for companies that would stand to benefit if Hams were to lose heart and lose spectrum. - Thus their rabid negativity, followed by ZIP, by way of constructive ACTION.

(Yawn)

It's best to ignore them. This geekoid is a prime example of what Ham Radio could do with a lot less of.

For the reading disabled: "100 users" above meant "100 users active at the
same time from one community." Assume they all run Napster or Gnutella.

This was intentional: I left it ambiguous (100 what?) to see how the responses
would run. Nobody took the obvious reading of "100 active users". Wonder
why that is? Because MURS is totally useless in that case. In fact, there is
probably NOTHING a hobbiest could build that would support such use.

Who will pay for the T3 link to cover the radio bandwidth?

Exactly right. He would need to purchase a controller that is useless
for anything other than Pinoak. All the other SailMail providers I'm
familiar with use off-the-shelf PTC-II as their "preferred" controller.

Some appear to support PACTOR as well as PACTOR-II.

Didn't find any that support CLOVER or CLOVER-2000, but only
spent 10 min. or so doing the search, and did not do specific search
for CLOVER or HAL.

I'm actually from Riverside/San Diego Counties :) That's one of the biggest reasons I don't go to the SCDCC meetings anymore. That, and the fact I usually stay at my place in Rosarito on the weekends. Believe it or not, I can hit ELANOD(East LA node) super-reliably on 145.09 in one hop from Rosarito(~140 miles) thru a beam using just 5W. It is amazing what you can reliably accomplish on 2m with a clear channel.

Wow. Do you see any solutions in the near term?

I heard somewhere(I think it was on TAPR's Spread Spectrum mail list) that 900Mhz devices "do better" than 2.4Ghz devices, as far as propagation is concerned. I think someone mentioned an "evil" multipath problem. Are they just covering their asses for choosing 900Mhz for the FHSS radio project, or is this a legitimate concern?

Do you really think that the fine folks at TAPR would put all the work they do into promoting digital radio, then promote 900 MHz if it was second best because one TAPR project uses 900 MHz? The leadership at TAPR cares very much about what they are doing and I have confidence that if they are recommending 900 MHz, it is not to cover their butts over the 900 MHz FH project.

Ah, but it was GREAT for learning the TCP/IP protocol! You could
actually WATCH all the handshaking going on - ESPECIALLY the
retransmissions that you don't normally see on an Ethernet :) Once I
convinced everyone in our area to turn ARPing off, 1200bps
TCP/IP "kinda worked". At 9k6, TCP/IP over AX.25 actually starts to
become usable.

Of course not!
Thus it's name (Simple Network Operating System).
As in K.I.S.S.
The goal was to give me a platform to play with various protocol ideas.
Which is what I'm doing right now.

> Actually though, most of the people in this group wouldn't know what Linux

Circa about 1984. I was able to connect to Phil's system now and again
from where I lived up near Boston.

The "tcp/ip folks" left 1200 baud and moved to the internet.
Darn few of 'em can manage to create even a minimal RF network anymore.

After watching the "fine folks at TAPR" actively discourage Amateur Packet Radio networking for years, insisting that Packet Radio be totally dependent upon the Internet for all "networking functions" instead, years after this policy was shown to be self-defeating and sverely counterproductive, nothing they say or do surprises me.

> The leadership at TAPR cares very
> much about what they are doing and I have confidence that if they are
> recommending 900 MHz, it is not to cover their butts over the 900 MHz FH
> project.

I would say that TAPR has a "chance" to recover, now that Greg Jones is no longer President of that organization, but I have seen the shape Greg left TPRS in, (The Ham organization he "headed" prior to his move to TAPR). GOOD managers leave an organization in better shape than when they first took the helm.... Greg's ego doesn't allow that, so he tends to leave them in a shambles. - Like TAPR is today.

Give Greg's cadre of butt-kissers and LandLine Lids a few years to hit the bricks, and TAPR just may recover and once more become a fine Ham Radio organization. Until then, don't put your money on TAPR coming up with ANYTHING actually useful. You'll get lots of hot air and hype from them, but no usable, useful results. That is the "LandLine Lid" way, and THAT is what has lost the US it's leadership position in the world of Amateur Packet Radio.

The European Packet Radio net is at least ten years in advance of the US "net" now, and to a very large degree, this can be directly traced to the activities of TAPR under Greg Jones' alleged "leadership". Greg is gone, but

his moronic, self-defeating policies remain. I'd like to see a fast recovery, but am not optimistic after seeing what happened with TPRS. (Texas Packet Radio Society)

Remember the NNC?

TNC-1, then TNC-2, then NNC, which was planned to give the
hardware base upon which we could build networks. That was ...
... without digging out my NNC architecture diagrams and looking
at actual dates but relying on memory ... about 1985. As far as
I know, none were actually built, although a few boxes of similar
design were created by more than one group. Nothing comparable
to the TNC-2 done since then.

When did TAPR become divorced from Modular Mining?

Right. Someone who has done some experiments with TCP/IP on amateur radio
(beyond copying the autoexec from a friend and asking for "TELNET NUMBERS"
on the BBS) knows a lot about the effects of the basic parameters.

What happens when you change the MTU, Window, initial retransmission
timeout. What is the difference between fetching two files sequentially in
one FTP session and fetching them simultaneously in two parallel sessions.
What is the difference between packets dropped by transmission errors and by
congestion. How is the routing done (what is a subnet). What is ARP
doing, and why. Etc etc etc.

Knowledge of things like that is invaluable when troubleshooting today's
IP-based networks. You may be able to learn it from a well-paid commercial
trainer who probably has never seen a network analyser himself, or you can
learn it using amateur TCP/IP.

A decade ago, you would have done that with NET or NOS, today you would use
Linux. But the result is the same.

PSK31 requires a (1 second, I think) tail of single tone at the end of a transmission. This is likely the delay you are experiencing. It is required to lock the squelch on the other end so that the receiving station does not get a bunch of random characters from the noise immediatly following the end of your transmission. It is not a good practice to eliminate this "tail".

3651. PSK Program under Windows 2000

for yr 2000

personally I've spent 600$ on slovinian 1.2mb/s data radio partial
kits. another member of NETCPA has spent about $800 on fully built
kits. a third member is buying the parts, building the partial kits,
and testing them. we should be looking for test paths in a month or
two (or three...).

with any luck by this time next year, we'll have megabit paths in
operation. end user paths are still a problem but there are some
solutions in the works.

> It's best to ignore them. This geekoid is a prime example of what Ham Radio
> could do with a lot less of.

you want less of people that do something constructive and that can play
nice with others?? boy, you do want ham radio to fail.

3654. PR:Logwindows 3.07.30 released

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-08 16:19:20 UTC
From: Rick Ruhl - CSS <ricker@cssincorp.com>
Message-ID: <_h8u5.5909$XR1.80242@news4.atl>
Source record: 11242

Log Windows 3.07.30 released!

Update adds many new features

Muscle Shoals, Alabama. September 8, 2000: Creative Services Software announced that version 3.07.30 of the popular logging program Log Windows has been released.

Log Windows 3.07.30 includes the following new features:
- Support for Top Ten devices band decoder
- Support for Alinco DX-77
- Direct support for the Icom IC-706 MKII
- Stop rotor function for HYGAIN and Sartek rotors
- Browse function for PSK mode (in search options)
- Added option for W4CSS parallel interface (5th message with MFJ Voice Keyer)
- Direct Support for the Rotor-EZ
- Added Grayline windows display.
- Added DXCC2000 reporting support.

And has the new features of the 3.07.XX releases:
- Telnet DX Cluster Access
- Support for new radios, including the IC-756 and the Ten Tec Pegasus (direct and GUI support)
- New logging mode options
- IOTA Support
- WinQSL QSL Manager Support
- QSLMaker 2.3 QSL Printing Program Support
- Full ADIF support
- Support for the W9XT CW keyer
- Support for the K8CC parallel port interface
- Icom-718 support
- TenTec Pegasus GUI control support
- Sartek Rotor support

"If someone purchases or upgrades to LogWindows 3.07.30 now, they'll not only get all the future 3.x upgrades, but also a FREE upgrade to the 32 bit version of LogWindows when it becomes available. So for minimal investment now, they are saving money in the long run", said Rick Ruhl,. President and owner of Creative Service Software.

The product retails for $69.95 and upgrades from release 3.06.15 or earlier are $40.00. Those who have purchased version 3.06.50 or greater will get this upgrade free. It also appears on the Digital Trio CD . It is available from dealers around the world, as well as direct from CSS.

Log Windows is owned by SCO, Inc and is maintained by Creative Services Software.

Creative Services Software is at http://www.cssincorp.com
The Log Windows homepage is at http://www.logwindows.com

Windows, Windows 95, Windows 98 , Windows NT and Windows 2000 are Registered Trademarks of Microsoft Corporation

Do you already have a 9k6-capable TNC? If not, I don't understand why anyone would pay more for a bulky single-band Radio AND TNC combination, when the Kenwood TH-D7A does it for a little over $400(and dual-band to boot).

Am I missing something here?

Ill do it..

> However the ham radio system connects into the internet must
> supply this bandwidth. How could that be done? Who would pay?

Ill do it.. Ill pay.. I doubt that any rf network could easily flood the bandwidth that I can get hold of. If anyone can build a high speed RF network and supply me with something that can be plugged into a linux box somehow, and make it legal, Ill get a large chunk of bandwidth to play with..

Interesting concept you guys are discussing [just came across it via
alt.radio.family]. A similar thing has been done on a housing estate
[project] in Manchester, England - where a bunch of residents all clubbed
together and set up a WAN in the whole block, which links to the Internet
via a high-speed leased line. It started off as a wired service [they ran
CAT5 all about the building !] but now they are experimenting with wireless
access to the units. Our Radiocommunications Agency in the UK permits
short-range wireless LANS so this can only operate within the block, but I
suppose its a start.

If any of you are interested I will try and find their website which
discusses the project...

When you want anything beyond AX.25 keyboard qso's, you will have to use
the KISS mode. That sucks.

To be seriously usable for 9k6, it should at least do 6PACK.

That's the whole point: if some ham can connect into the internet,
so can everyone else around them. High speed links that hams
might provide could span perhaps a few miles to maybe 50 miles.

Useless.

Not to mention the fact that it requires a Sonet *modem* to
plug that OC3 into some computer.

Cool!
How ya gonna get that RF network to me?
Is about 10,000 miles. Explain.

> plug that OC3 into some computer.

I can get an OC3 to the linux box - dont worry your pretty little head about how.. you just worry about how you are going to suck that much out of it and put it on the airwaves, cos that is the bit that I dont know how to do, and dont have the time to find out.. I was just pointing out that there is plenty of bandwidth to be had if the hardware existed.

> Cool!
> How ya gonna get that RF network to me?
> Is about 10,000 miles. Explain.

I'll provide bandwidth - thats all.. If you want an RF network spanning 10Kmiles, thats your problem (or the problem of those who said they can do it).. I havent the feintest idea how to do that..

But elaborating a little further, if someone does come up with an setup that will work, Id even put in some work getting people to set up stations in my area and proving the conept.. Get someone clueful enough design/make the gear and Ill provide a place for it to run with enough Internet to soak your keyboard..

scott..

3664. TH-D7A secrets

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-08 23:13:26 UTC
From: horseshoestew@my-deja.com
Message-ID: <8pbrq7$ue0$1@nnrp1.deja.com>

How did Kenwood manage to get a 9k6 modem to fit into such a small space on their TH-D7A radio(not to mention a dual-band radio with two serial ports). Has anybody opened up one of these puppies yet?

The old 1200bps Amateur TNCs have a special modem chip(but most of them are still huge because nobody bothered to upgrade the technology in the last 5 years - save PacComm with the picoPacket). The old 1200bps modem chip has been available for years(since the 80's). I believe it was put out my AMD, and was called the "World Modem Chip" because it did both Bell 202(old European 1200bps telephone standard, and ham packet standard) and Bell 212(old American 1200bps telephone standard).

But the TAPR 9k6 modem has a bunch of discrete stuff, the thing costs $80 for a kit - and the thing is HUGE! Are there now commercially available modem chips(or chipsets) that will do the job for 9k6 packet?

It kind of irks me that TAPR is stumbling around with another huge project that they aren't going to finish(the FHSS radio, like the packetRadio before it). My feeling is that they should have continued to build on past successes, or existing designs - rather than embark on an outrageously optimistic journey into totally uncharted territory. The TAPR 9k6 modem works well. Evidentally, it works better than its predecessor the TAPR K9NG 9k6 modem(I believe it is based on the G3RUH design, which is superior). However, it is MUCH bigger, and much more expensive($80 vs. $35) than the old K9NG. Why didn't they just work on improving this design - getting the cost and size down? Now that handheld wireless is becoming a reality, and the need for small, inexpensive and reliable 9k6 modems is upon us again - TAPR is left to play "follow the leader", when they could have had a 5 year jump on the industry!

The TAPR site at least had the following links:

YAM (Yet Another Modem):

http://www.microlet.com/yam/

BayCom (Bavarian Packet Radio Group):

http://www.baycom.org/

Apparently the Europeans have leapfrogged us(at least in the low-
bandwidth digital world). Has anyone experimented with any of this
stuff?

I wouldn't doubt that these guys just took the TAPR 9k6 Modem design,
and put it on an FPGA!

Sorry if I seem like Rip Van Winkle, and am asking some old questions,
and drawing some old conclusions - but I got out of the packet radio
scene in '95, and just recently got back into it. It looks like TAPR
has been sleeping too.

I'm I calculating correctly here? The price of the YAM PCB is about
$10, and the FPGA will cost about another $15. I would assume the cost
of the descrete components won't amount to more than about $5. So you
can get the kit for about $30. That is FAR less than the TAPR modem

behemoth's $80 price tag. If the European modems work - why does TAPR even BOTHER to sell this boat anchor anymore? This seems to be a dis-service to the Amateur Community.

Am I wrong in asking "What the HECK is going on at TAPR?"

I'm more convinced than ever that they are only interested in their FHSS science project, and have lost all sight of the applications end. I feel like a dipshit for renewing my membership for $20(after letting it lapse for 5 years). Are these guys just a bunch of "high-compression heads" or what?

My understanding (and I may be wrong) is that Kenwood designed
a special purpose IC containing the 1k2 and 9k6 TNC. They will
now include this IC many of their radios. For example, their
new radio covering HF through 1296 will utilize the same technology.

No doubt, there was some significant development cost in producing
this, but they are now the only one of the big three (YaeComWood)
with TNC functions in the radio.

I'm saying that developing this special application IC is an
investment not a major scientific breakthrough.

Maybe this will sell radios for them. Icom's gimmick (if you will)
seems to be these large color LCD displays. Yaesu, evidently,
doesn't need a gimmick.

It sounds as though you have a bone to pick with TAPR.

I do not have answers to your questions and I was quite disappointed to see what happenned with the TAPR weather station recently.

Could be historically that some other opportunities were missed, as well.

But, let me say that TAPR accepts proposals for projects and anyone (as far as I know) is welcome to submit one.

I think the fundamental limitation may be the motivation of the membership and not any conspiracy on the part of some ruling party within the organization.

Your point is well taken, though. Kinda like the old saying "What have you done for me, lately?"

Oh, now I understand.
You know nothing at all about radio.

> But elaborating a little further, if someone does come up with an setup that
> will work, Id even put in some work getting people to set up stations in my

What concept?
Providing short distance (" ... in my area ...") RF internet?
It's trivial.
Many hundreds or perhaps even thousands of hams have done this.
Since 1984.

> Get someone clueful enough design/make the gear

Any US Ham who has supported TAPR in the last decade should have a SERIOUS "bone" to pick with TAPR. They didn't just drop the ball; They poked a big hole in it, and then sat on it.

> I do not have answers to your questions and I was quite
> disappointed to see what happenned with the TAPR weather
> station recently.
>
> Could be historically that some other opportunities were
> missed, as well.

Yep: Everything TAPR has touched during the time "you know who" was providing "leadership" for that organization... TNC95 is another example not named so far in this thread. There are plenty of others.

> But, let me say that TAPR accepts proposals for projects
> and anyone (as far as I know) is welcome to submit one.

That's right. But by doing so, you are assured that your proposal will come to precisely NOTHING. Ham-Web, for example, was a brilliant idea that TAPR made sure would not happen by assuming control, then putting it into limbo. This is the usual pattern. Submit it TAPR, watch it die on the vine.

> I think the fundamental limitation may be the motivation
> of the membership and not any conspiracy on the part of
> some ruling party within the organization.

Under it's former (pre Greg Jones) leadership, TAPR came up with a good reputation for itself. After Greg came in, the hype level went up, and the accomplishment level went close (very close) to zero.

Blaming the membership is not going to change the facts. Sure, the TAPR membership was cheated, gulled, and ripped off. - But it was an internal clique surrounding TAPR's "leadership" that effected those nonproductive effects. THEY are to blame, not the people they systematically ripped off and lied to.

Blaming "Joe Ham" is typical "LandLine Lid" bull... Stick it. We Hams are getting sick and tired of that particular whine.

> Your point is well taken, though. Kinda like the old
> saying "What have you done for me, lately?"

TAPR has done one really outstanding thing, lately... They lost Greg Jones.

Now if they can get rid of his cronies and restructure with a new bunch of rascals, they MIGHT have a chance of getting their reputation (and usefulness to the Ham community) back again. The current BoD is too polluted with wrong thinking to help themselves. - They will just carry on with more of the same stupid, nonproductive thinking, tons of hype, and zero accomplishment.

>available modem chips(or chipsets) that will do the job for 9k6 packet?

A 9k6 packet modem, in principle, is simpler than a 1k2 modem. That is
because it does not modulate/demodulate but it simply (digitally) scrambles
and descrambles the data. A lowpassfilter and a dataslicer finishes the
whole thing up.

Single-chip designs (and other designs much simpler than the original
discrete design) have been available for many years, but apparently not
from TAPR.

BTW, after your "world chip", which was nice but overkill for packet, there
has been an era when the TI TCM3105 was widely used for 1k2. It was
smaller and required less power (and only +5V power). It was also
available in SMD, and modems fitting in an RS232 connector were produced
using that chip. Now, it is no longer produced (the chip makers, unlike
radio amateurs, consider 1200 baud AFSK a thing of the past).

But it seems like the folks in the USA have missed most of this stuff.

From: kf4sir@earthlink.net
Message-ID: <39ba5acd.17276641@news.earthlink.net>
Source record: 11114

Hi all, I had some very encouraging results from the relay tests I ran on Sept 9,00.

MFSK16 did very well indeed and we were able to get 100% copy on all the test that were run. I was running about 12 watts output to a inverted V dipole up 9 meters. This type of antenna could be set up very easily at just about any portable site.

One of the best samples of how well MFSK16 did is in message number 63 at:
http://www.egroups.com/group/psk31relay

Message 63 was sent from my Orlando QTH and received by Sandy, N2SF at his NY QTH - a distance of over a thousand miles!

There has to be some public service potential in that! The ability to send a accurate message more than a thousand miles using free software, a soundcard that most computers already have and a HF rig. Then have the message posted for public viewing quickly.

The only item that is required that a lot of hams might not have is a good laptop computer.

I run a Compaq 200Mz laptop and they can be bought used at very good prices.

It's pretty easy to justify the purchase of a laptop computer because they have lot's of other uses besides ham radio.

Well, that's all for now.

Bullshit!

Ham radio is whatever you want to experiment with, that involves a
radio.

It might be an Autopatch, an Internet, or a Part-15 Spread Spectrum
LAN, or even another radio link; but, the Ham radio at each end makes
it all Ham radio.

Anyone who says different is a filthy bastard.

Jimmy

Gee! That's amazing how the telephone magically becomes an "amateur Radio"
station if you hook up a Ham Radio to one end or another of the telephone
link... I bet that works for signal flags too, huh? Can't wait to hook up a
10 ft. link between my handy-talkie and my telephone so I can "dial up" my
dxcc!

> Anyone who says different is a filthy bastard.

Yes, I can see how you have applied flawless logic to your alleged
"thinking" on this matter. A proud day for amateur telephone!

Bob Lewis wrote that the "tail" built in to the Tx/Rx changeover was to hold the squelch at the receiving end. I feel that this is not of too great validity as it is only " putting off the evil moment" by 1 to 2 seconds and this would require very nifty action by the distant op to avoid a few junk characters from arriving. Many stations take up to 5 secs or more to reply. In any case, whereas squelch is fine on VHF/UHF channels, it is of little use on H.F unless one has condx of low noise/high signal/ minimal QSB etc.

Has anybody here in the states bought/built one of these 'yam' modems?

I did not see any reference to a KISS mode, anybody have any more info than what's at the site listed??

I was into the 9.6k baud packet stuff for about 2 years till the guy running the local tcp/ip switch pulled the plug, I built and tested 2 of the TAPR 9.6k modems, modified and tested a couple of Motorola Micors to work with them. I am now looking to use something similar to do remote control via packet.

> I'm more convinced than ever that they are only interested in their
> FHSS science project, and have lost all sight of the applications end.

I heard that was on hold or shuffled off to some commercial use for a few to make bux on, and the amateur end was lost in the shuffle.

What is the difference between using a telephone with touchtones to control an amateur station and what you're claiming? You seem to have this irrational fear of using the internet despite posting usenet groups which require the internet for distribution. Further, it's irrelevant to me how a signal is propagated if the means of propagation don't have a non amateur acting as control operator, so whether a signal goes through the internet, the ionosphere, or 3700 amateur UHF auxiliary stations is just of technical interest to me. Quite frankly, unless amateurs begin experimenting with things and finding new usages, amateur radio won't be around for long. What new usages have you got to play with that will attract 11 year olds? what new usages that will attract lots of technically inclined 60 year olds for that matter. Unless amateurs use amateur radio and find things to attract newcomers, it will die if just because there are no replacements for those who leave or die.

Interesting way of thinking. So if you have a radio, and plug it into
something, then that something becomes Ham radio? That whatever
you interface the radio with is really the defining object. Why would
the telephone system become Ham radio?

If you plugged an answering machine into the telephone system, would
the telephone system become an answering machine system?

Hi dave-n2rhl,

VE3SNP Packet BBS is located in Port Colborne Ont. on freq. of 145.790
Mhz.

The sysop of the BBS is VE3MX Ron Kramer and assy. sysop is myself
VE3HVS Denis Dubois.
Hope this info will help.

Well Art, what you suggest is kinda silly isn't it?
The hobby is about radios, not telephones.

What you propose is that hams use "new things" and avoid using
those "old things" like radios, antennas, feedlines, etc.

You have any clue how silly that sounds?

PART 97--AMATEUR RADIO SERVICE
Subpart A--General Provisions
S 97.3 Definitions.
(a) The definitions of terms used in Part 97 are:
(4) Amateur service. A radiocommunication service for the purpose of
self-training, intercommunication and technical investigations carried out
by amateurs, that is, duly authorized persons interested in radio technique
solely with a personal aim and without pecuniary interest.

Now you've heard of it.

Where's the part that restricts an Amateur from interfacing it to another
communications system (e.g., a modem, a network, etc)?

Made it all up didn't you?

When exactly is the following communication not a radio communication
service ? In all the following examples there is at least two
transceivers communicating with each other using frequencies assigned
to amateur service and obeying to the rules for amateur radio
communications.

1) A battery powered HT with attached rubber duck antenna and built in
speaker. This is a truly wireless case :-).

2) A transceiver with a built in antenna and external microphone and
headphones (or a connection to a PC for RTTY/PSK31).

3) A transceiver with cordless (IR or RF) headphones and a cordless
microphone.

4) An indoor transceiver with a coaxial cable to an antenna on a
tower.

5) A tower mounted transceiver (e.g. Gunnplexer) with baseband audio
cabling down to the shack.

6) An transceiver mounted in the attic of an apartment building with
external antenna and audio connection down to the apartment using
spare pairs in the apartment building internal telephone network to
carry the audio down to the apartment of the operator.

7) The transceiver is at the top of a high building and the operator
is connected to it from an other building using a telephone pair
leased from the local telephone company.

8) The same as in the previous case, but the connection is over a
virtual circuit over internet.

In all cases the transceiver is used to communicate with other amateur
radio transceivers. In which case is the communication not a radio
communication service ?

>radio transceivers. In which case is the communication not a radio
>communication service ?

It is not amateur radio when these cases are modified to:

1) a GSM phone connecting to a commercial provider and you making a call
to another amateur

3) a PC connected to the Internet and using cordless keyboard or mouse
operating on amateur radio frequencies

6) a cordless phone is constructed to work on amateur radio frequencies
and to make a phonecall while you are in the shack, using the cordless

link to communicate with the base station in the living room.

8) an amateur radio link is used to connect a machine on the Internet
(probably connecting to some chatbox, a voice interconnect etc) with
a local operator using amateur radio frequencies.

The obvious difference between your examples and these, is that the main
part of the link has nothing to do with amateur radio.

Phone patches are not amateur radio, and in fact they are only allowed
in a few countries. Most amateur radio license conditions preclude them,
or in fact any other connection to other external networks.

>I did not see any reference to a KISS mode, anybody have any more info than
>what's at the site listed??

The YAM modem is a MODEM, not a TNC. Thus, the reference to a KISS mode
is irrelevant. It does modulate and demodulate the HDLC bits.

This is in fact a situation preferable over KISS.

In some situations, it may be useful to have a TNC with firmware running
(e.g. for standalone telemetry stations, maybe for APRS although I have not
seen suitable firmware for that, etc).

In the normal case, however, today's PCs have much more power than a TNC
would have, and it is best to leave the AX.25 protocol handling to the PC
instead of inserting a TNC between them.

US Digital Dichotomy!
by Charles Brabham N5PVL

Having trouble getting those last few contacts for your DXCC?

Use the Telephone!

It's easy! It's fast! It costs less! It requires no knowledge
or ability whatsoever!

Still can't talk to those rare and distant countries on 10 meters,
even with an expensive new tribander?

Use the Telephone!

Do you have NTS Health 'n Welfare traffic which must be moved to a
recipient several hundred miles away?

Use the Telephone!

Want to build an Amateur Radio Digital Network?

Use the Telephone!

Want to reliably communicate with distant Hams while radiating
a minimum of RF?

Use the Telephone!

For some strange reason, in every aspect of Amateur Radio except Packet,
it is widely recognized that using the Telephone is not an appropriate
response to the challenges we face as Ham Radio operators.
Everywhere else, there is an unspoken understanding that as Hams,
we are expected to be clever in our use of Radio and in the process
of overcoming those challenges, advance the art and better ourselves
as persons.

Why is it, I wonder, that the type of information we transmit
(Digital as opposed to Analog) makes any difference in this matter?
Why is it "OK" to bypass and undermine the use of Radio by Hams who
want to transmit Digital info, but not "OK" to do so for Analog stuff?

Is there a particular reason why advancing the art of Amateur Radio
in respect to moving Digital info is deemed to be of less importance
to us as Hams? Is there any logic behind the widely-held perception that
as long as you are handling Digital info, it doesn't really matter
(As a Ham) whether you use Radio to communicate or not?

In places where the regs specify that non-ham means of communication not be allowed within the Amateur Radio Digital Net, there has been unchecked progress and advancement over the last decade.
In those places where the use of Packet/Internet gateways have not been regulated though, the opposite has happened and Network infrastructure has been severely compromised while Hams have lost interest and heart in large numbers. This is what has happened to the USA, Australia, and other places where "packet hackers" have been given a free hand to do as they wish.

I have read about FlexNet nodes in Europe which regularly handle 10 Megabytes per hour and more of traffic. That represents a high level of both physical and technical development and advancement, along with a high level of interest and enjoyment among the individual Packet ops there.

The difference is infrastructure. Use the Telephone instead of Radio, and infrastructure is what you give up. Sure, it's a challenge to build a digital network; It's expensive, difficult, frustrating, and sometimes appears to be impossible. The alternative though, is the mediocrity which follows those who prefer to cop out, cheat, and cheapen themselves while they undercut others.

I just don't see why our response to the challenges we face as Hams should be different when wanting to move Digital as opposed to Analog information.

I do not see why Hams using Radio is treated as being less important in the US than it is in Europe.

Notice how "Hoffa" doesn't identify himself, and has never mentioned a callsign?

Another non-ham SPAMMER, out to disrupt discussion by legitimate hams. If it weren't for his juvenile fascination with "potty language", I would suspect him of being employed by a corporation that would stand to benefit when Hams lose spectrum.

I think it's important that we realize that as commercial wireless Internet grows, we will be seeing more and more SPAMMING by would-be (wanna-be) wireless Internet "professionals" in the industry. I quote the word "professionals", because the REAL professionals have no need or desire to interfere with the Amateur Radio community. - It's just the ones who can't make the grade on their own who feel some great need to disrupt the activities and discussions of legitimate Hams.

It is "widely recognized" that phone patches save lives.

> Everywhere else, there is an unspoken understanding that as Hams,
> we are expected to be clever in our use of Radio and in the process
> of overcoming those challenges, advance the art and better ourselves

Unspoken understandings? Interesting. The airlines had an unspoken
understanding that passengers could hook up their seat-belts. After
several were killed, they now force their crew to brief everyone on how
to connect the two pieces of metal.

> Why is it, I wonder, that the type of information we transmit
> (Digital as opposed to Analog) makes any difference in this matter?

If you had been actually reading the messages, you would know that
there is no distinction between analog and digital. There were examples
of phone patches in previous postings.

> Why is it "OK" to bypass and undermine the use of Radio by Hams who
> want to transmit Digital info, but not "OK" to do so for Analog stuff?

There is no such "unspoken understanding." Analog voice is often
interfaced to non-radio devices. Is this the dichotomy you speak of?

> Is there a particular reason why advancing the art of Amateur Radio
> in respect to moving Digital info is deemed to be of less importance
> to us as Hams? Is there any logic behind the widely-held perception that
> as long as you are handling Digital info, it doesn't really matter

There is no dichotomy, analog and digital are both interfaced to other
communications systems often, and easily.

> In places where the regs specify that non-ham means of communication not be
> allowed within the Amateur Radio Digital Net, there has been unchecked
> progress and advancement over the last decade.

References? Magazine articles, or studies of this?

> In those places where the use of Packet/Internet gateways have not been
> regulated though, the opposite has happened and Network infrastructure
> has been severely compromised while Hams have lost interest and heart
> in large numbers. This is what has happened to the USA, Australia, and

> do as they wish.

References? Most agree that packet radio died where commercial services
became cheaper and better connected. In many places in the World, the
communications systems are regulated and expensive, therefore the use
of ham radio to bypass this system, makes it very profitable.

> I have read about FlexNet nodes in Europe which regularly handle
> 10 Megabytes per hour and more of traffic.

I've heard of the Easter Bunny. The obvious question is: where do they get
this data from? What could possibly require 22 kb/s other than MP3 music?

> That represents a high level
> of both physical and technical development and advancement, along with
> a high level of interest and enjoyment among the individual Packet ops
> there.

It represents maybe 2 nodes out of 200. If the system were as good as you
"heard" then the commercial system in Europe would collapse as everyone
got a Ham license and bypassed that system.

> The difference is infrastructure. Use the Telephone instead of Radio, and
> infrastructure is what you give up. Sure, it's a challenge to build

Infrastructure? How many long distance nodes has your club put up?
How many have you personally put up, that are still operational?

> I just don't see why our response to the challenges we face as Hams
> should be different when wanting to move Digital as opposed to
> Analog information.

There is no dichotomy. It's all in your mind. The phone patch is often
used on HF and VHF.

> I do not see why Hams using Radio is treated as being less important
> in the US than it is in Europe.

Europe is not a good comparison. Most of the countries are socialist,
and the high tariffs are what make Ham radio bypasses cost effective.

The topic involved using the telephone system to avoid or
bypass ham radio links. You have even *one* example
where a life was saved using this technology?

I thought not.

Not really. Just that I feel like a dolt for supporting them.

To be fair, I may have gone a bit too far when I blasted them for still including their 9k6 kit on their web site, because some good might come out of it if experimenters use it to build their own working model to copy and put into an FPGA. However - they ought to make it very clear that is ALL it is good for; otherwise they are just ripping of unsuspecting hams.

Even the in many ways outdated relevant portions of Part 97 (USCFR 47) allow control links for example, and remote operation. Further try as I might, I can't find any section of said rules barring let's say sending the audio from a receiver to another point for retransmission if the original signal is lawful on amateur radio. I'm less offended by folks who want to for example set up a linked set of repeaters using the internet as part of the link mechanism (I am of course assuming adequate security measures so that non hams can't get access) or as the means of sending the audio and control signals.

Your argument is sort of the equivalent I used to hear from simplex operators about repeaters, namely that if the signal couldn't be heard directly by the receiver/antenna combination, it wasn't worth worrying about. I note that simplex operation on 146.52 while traveling gets few responses too just so you can see a possible flaw in the logic already.

My point is that unless hams find some way of attracting folks who want to experiment in lawful ways, it just becomes a way of building things others have already been doing for quite a while. Hams aren't pioneering in the greater than GHz range, most in fact have to use surplus outdated parts just to get on in that region. Hams in this country aren't setting up their own licensed wireless large scale high speed (in the greater than one megabit range) LANS or finding new means of communicating either. PSK31 is a great thing to play with, but all too many folks seem to have to buy a rigblaster to interface the rig to a soundcard, rather than building their own. You apparently prefer the present setup, and I'ld rather see folks trying new thing interfacing one amateur rig via the internet to another than folks who have to have guidance on how to hook up a soundcard properly to an HF rig. The internet is here, I'ld love to be able for example to be able to talk with friends in let's say Chicago from where I live now just using a handheld rig let's say, but it's not going to happen soon, we don't have the infrastructure, it could be possible using internet relaying to solve some of the problems, but for some reason, you don't like that solution and deride it. Face it, people now can talk and communicate with folks in foreign countries via the internet via IRC,

netmeeting and various and sundry voice and typing equivalents, and they can do it much more reliably than I could ever have done it using HF propagation. Why not make use of that capability and still encourage folks to use amateur radio?

The common misunderstanding seems to be that one group argues that
interconnection should be allowed to attract new people, and the other
group argues that routing a qso via the telephone is not amateur radio.

I think the second is certainly true.
The first may be true as well, but when that is the case we should not
discuss the allowance of those extra links, but the introduction of a new
hobby that allows such interconnections.

In fact, here in the Netherlands it was already introduced a decade ago,
and it was called MARC. It is equivalent to what you US guys call CB.
It is a license-free radio communications hobby, and the users are allowed
to do anything they like (talk, send music, do packet, use profane
language, you name it) as long as they don't modify the transceiver output
power and don't use directional antennas.

Maybe you need a similar system?

No, it is not similar.
You are confusing the internet with radio.
Please think about it.

> My point is that unless hams find some way of attracting folks who want to

Exactly correct. Such high speed network *cannot* compete with
the internet links that have become the standard way to connect one
ham radio digital system to another here in the US. When one attempts
to set up such networks, there is no traffic for them to carry: it gets
there first via the internet links.

Please think about this.

> PSK31 is a great thing to play
> with, but all too many folks seem to have to buy a rigblaster to interface
the
> rig to a soundcard, rather than building their own. You apparently prefer
the

Perhaps just ignorance on your part, but I *certainly* do not "prefer" the
present setup. After spending five years building digital network, and then
watching it be destroyed over the next ten years, you bet I don't like the
"present setup". There was a lot of experimentation going on ten years ago
before a few (and eventually quite a few) hams took it upon themselves to
destroy that network by forcing the traffic to go over the internet instead.

Please think about this.

> and I'ld rather see folks trying new thing interfacing one
> amateur rig via the internet to another than folks who have to have guidance

you
> don't like that solution and deride it.

See above. When you use the crutch of the internet to avoid doing the
hard work of building ham radio capability ... that capability will *never*
get built. There is no longer any reason to build it.

If you want to talk to Chicago with your HT, start convincing hams to build
some links from (wherever you are) to Chicago ... using ham radio.

If you want to talk to Chicago, use an appropriate ham band.

If you want to talk to Chicago, build your remote base that let's you use
your HT to control your HF station, and talk to Chicago.

I've heard your "justification" for avoiding ham radio over and over.
Sounds just as silly now as it did ten years ago.

> Face it, people now can talk and
> communicate with folks in foreign countries via the internet via IRC,
> netmeeting and various and sundry voice and typing equivalents, and they can

> it much more reliably than I could ever have done it using HF propagation.
Why
> not make use of that capability and still encourage folks to use amateur
radio?

What would you encourage them to do?
Why would they want to do that?

No point for them to get on HF, they can *already* talk to you using the
internet.

No point for them to build HF-linked-voice-repeaters, they can already
talk to you using the internet.

No point for them to use radio at all is there?

Unless of course what you are interested in is RADIO.

I guess I worded my question wrong. I did see drivers / etc. to be able to setup and operate this 'modem' in different modes. I guess I should have asked if there was a DRIVER available to operate in KISS mode. It seems to be a less expensive alternative to the TAPR modem and looks to be less components so easier to assemble.

There a third group that I belong to, that argues for interconnection because it is legal, it is part of the hobby, and it is enjoyable. How I see the arguments
against this, is that it is not pure. That operating without interconnections is the only way. That my enjoyment would be greater if I joined their clan.

Is the group I belong to going to produce something better? I don't think so. It is just a hobby. Nothing will become of it, because few participate.

I remember a quote from General Patton which says: "If everyone is thinking alike, then no one is thinking." Something to that effect. What he meant was, that no new ideas could be developed, or that ideas which could seize the day would be stifled in a self imposed, conformal, and righteous group. He hated "Yes Men" and I concur. "Yes Men" are bad; bad, bad...

You can picture this purity group all huddled in a corner throwing sneers every now and then, and rejoicing in their purity even though everyone else is enjoying their hobby in a legal manner. It is not peer pressure, because none of those imposing purity could ever rise to this third groups level.

But none of these groups is really going to produce anything of value.
If Internet prices in the U.S. tripled, there still wouldn't be greater numbers of HF and VHF links. That part of the hobby is over. There is no amount of Ham data that requires this network or link. It goes against hobby communications, and that is why it fell apart (not to mention that it was buried under a half-ton of WW messages from Brazil and West Africa).

9k6 modem can occupy just a part of some custom chip ...

Way back when ('86?), Telereader put pretty much a whole
TNC-2 into a single gate array. So the digital part is "easy".
The analog part requires a mixed-signal custom chip, but
that's no longer a big deal.

So Based on that logic the Phone Patch on the local repeater is not Ham Radio.
So I can use it as I please. Order Pizza, Call the office and check messages etc.

Ham Radio is what ever you make it.
It's not just CW & SSB on HF. That's the beauty of this hobby the ability to experiment with new technology. It's that experimentation in new technologies that will keep out bands. If we don't make the inovative technological leaps we have been know for we will loose the bands to comercial interest that will spend Billions of dollars for the frequencies we have used for years for free.

What's funny is that some of the TCP/IP hams are still active on the air, one way or another, while most of the folks I saw opposed to such usage have become big users of things like ICQ, and usually just gabbing on the internet.

Hams had occasional unreliable TCP/IP networks, and tried to used the internet to solve lots of problems, the only problem is that all too many folks got interested in web pages, and the other goodies on the internet. I know all about the horrors of trying to keep an RF only system going, and it ain't pretty when a necessary link drops out, or your connection path is marginal to non-existent when there are leaves on the trees. While hams conceivably could build a nationwide RF equivalent to the internet, it would still be reproducing what others are already doing better and with more capability, and were doing better with mostly RF (remember that the "M" in MCI stood for Microwave). It might be desirable to build such a network from some points of view, but the need has been apparent since at least 1985.

Sorry, but we couldn't for example do this conversation via packet without huge long delays, and a good chance that responses would either never show up or show up days later. Just as hams probably have to get over thinking that it can impress the public by being a non-commercial western union and use CW to send lots of traffic from state fairs and the like, we've got to get over the sole dependence on straight RF paths unless we can actually set them up and maintain them in Brightest Day, and Blackest Night, coldest weather and scorching heat. Besides, our biggest investment in RF infrastructure, namely two meter repeaters seems to be slowly becoming boxes with occasional users at rush hour, and otherwise they're quiet for all too many of them. In fact, I can hear three machines near me that on weekends might not ever get a voice repeated through them. Repeaters, even 9k6 TNCs or soundcard programs aren't going to attract folks with DSL or cable modems as innovative and new things to experiment with, and neither is a system dependent mostly on 1200 baud packet signals being relayed unreliably.

Which is fine, you're not missing much.

Our rules allow it, and that's the end of that argument. So we can close this stupid, semi-annual, thread for now.

>And so do most of them.

Over here it has been legal since 1997 to connect an amateur
transceiver to other networks. The traffic must still be amateur radio
traffic, so phone patches are out of the question.

There has been some talks about repeater linking or remote repeater
receiver linking, but as far as I am aware of, the problem has been
getting any network connections or leased lines at reasonable prices
to the repeater sites.

>I don't think it is fun, either.

In countries where you have active clubs within line of sight paths
the situation may be different, but when the population and ham
density is so low that it is hard to find active clubs within reliable
2 m path distances, maintaining "pure" networks requires quite a lot
of masochism.

3723. Computer and external DSP noise filter

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-11 13:15:07 UTC
From: Mark Erbaugh <mark@nospam.microenh.com>
Message-ID: <39bce022$0$35378$2a0ee87e@news.tdin.com>
Source record: 11159

Does an external DSP noise filter or an AF stage DSP in the rig make any difference in copying digital modes with a computer using a soundcard? The computer has to do DSP processing to retrieve the information anyway and I suspect that it does a decent amount of noise reduction processing in the process, so it would seem to me that the external DSP would be superfluous. In fact, I could see where there might be some artifacts of the A/D and D/A process that could even make things more difficult for the computer.

As others have pointed out, they've integrated a small OEM TNC from
Tasco Japan.

>
> The old 1200bps Amateur TNCs have a special modem chip(but most of them
> are still huge because nobody bothered to upgrade the technology in the

> did both Bell 202(old European 1200bps telephone standard, and ham
> packet standard) and Bell 212(old American 1200bps telephone standard).

The World Chip came in a huge 28-pin DIP. I suspect there wasn't enough
demand to offer it in a smaller surface-mount package, but the majority
of the bulk was the package, not the chip. The only technology that needed
"upgrading" was the packaging.

However, the TCM3105 modem is/was available in a small-outline, surface-mount
package and also uses a single +5V supply (unlike the World Chip which requires a
negative supply as well which adds bulk to a product).

> But the TAPR 9k6 modem has a bunch of discrete stuff, the thing costs
> $80 for a kit - and the thing is HUGE! Are there now commercially
> available modem chips(or chipsets) that will do the job for 9k6 packet?

Sure there are commercially available modem chips for GMSK 9k6. MX*COM
makes several suitable chips. The TAPR design is kind of neat if you want to
learn how a 9k6 base-band modem works, though.

> The TAPR 9k6 modem works well. Evidentally, it works better than its

> handheld wireless is becoming a reality, and the need for small,
> inexpensive and reliable 9k6 modems is upon us again - TAPR is left to
> play "follow the leader", when they could have had a 5 year jump on the
> industry!

I don't believe the TAPR modem performance is *that* much better than that of
the K9NG modem, but TAPR's modem has a better interface to the TNCs.

The TAPR modem is similar in some respects to the G3RUH modem but lacks
a couple of features - the G3RUH modem permits pre-distorting transmitted
data to compensate for receiver distortion, and the G3RUH modem has a fairly
sophisticated clock/data recovery design. The pre-distortion feature was neat
for point-to-point links but not practical for the real multipoint world, the clock
recovery scheme was good.

What good is a 5-year jump in the Amateur Radio packet industry anyway?
I don't know if you've noticed, but extrapolating 5 years into to the future, there
may not be any packet radio products being made. Hams are kind of fickle when
to comes to experimentation and the simple fact is the the wireless professionals
are *way* ahead of packet. The cold, hard truth is that hams were excited to send
data at all and were totally hung up on the neatness of sending data, and that's
not what is exciting. Services, what it does for you, are what is exciting, and services
require an infrastructure and services architecture. Ham radio has the BBS system,
DX Packet Spotting Cluster and APRS. The only service that benefits from being done
via radio is APRS and that's remarkable because it is effectively a one-way service.

3725. Broken TASCO TNC (was Re: TH-D7A secrets)

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-11 14:22:00 UTC
From: "Dana H. Myers K6JQ" <Dana@Source.Net>
Message-ID: <39BCEA88.A1653C7A@Source.Net>
Source record: 11161

Does the Alinco Tasco TNC have the same bug that the Kenwood Tasco TNC does?

That is, on AX.25 connections made using the TNC (not via KISS, but using the TNC's firware), all frames essentially are sent with the Poll bit set (even when not necessary), and the Tasco TNC does not have an acknowledgement timer! The Tasco TNC simply does not send acks until it hears a frame with the Poll bit set. In a connection where both ends are sending I-frames, the ack will piggyback on each sent I-frame, but that's not a common use case.

This means that one Tasco TNC will talk to another pretty well (every I-frame is ack'ed immediately in response to the always-set Poll bit), but a Tasco TNC talks poorly to other TNCs. Since the Tasco TNC never acks an I-frame that doesn't have the Poll bit set, the Tasco TNC is *always* waiting for the other end to time out and send a RR(P) before responding with an ack.

If you connect to a packet BBS to read messages, the throughput is very poor.

I wrote Kenwood a letter about this but they've totally ignored it as far as I can tell. Maybe I should put together a web=page with a packet trace on this topic. The same problem is known to be present in the TH-D7 and TM-D700.

Dana,

When I talked to Jeff Rienhart at Dayton, he said that the first version of firmware they had from the Tasco people did have the same problem as the Kenwood, it would transmit, but not receive. he said that the second revision fixed it.

My guess is if it's in the current version of the Kenwood radios, it'll be in the version for the Alincos. I'll get Tim to give Naki at Alinco a call and see if he is aware of this.

3727. YAM modem at 2400bps? and other YAM questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-11 16:41:34 UTC
From: horseshoestew@my-deja.com
Message-ID: <8pj1vp$n6j$1@nnrp1.deja.com>
Source record: 11163

Has anyone played around with trying to get the YAM modem working with Manchester-encoded 2400bps? The Flexnet drivers only support 1200 and 9600 operations. I don't know about the Linux drivers, but I would be most interested in them as they come with source code!

Could the YAM be used at 2400bps with unmodified commercial ham radios? This would avoid the problem of having to modify radios to hook directly into the varactor and discriminator.

Is it best to order the YAM's from Nico Palermo's site?

http://www.microlet.com/yam/

Does the PCB come with all the discrete parts other than the FPGA? Is it better to get the FPGA along with the modem, or just get the FPGA here in the USA through someone like DigiKey?

If Nico's PCB doesn't come with discrete parts, is it possible to order them thru someone else? The following site mentions that a kit can be ordered:

http://www.infracom-fr.com/yamg.html

If Nico's PCB doesn't come with all parts, does this one?

I would really appreciate feedback on this.

What about the Surface Mount Device(SMD) version of the YAM modem:

http://www.qsl.net/dg1scr/pr/yam/index_e.html

What ever happened to this? I don't see anyplace to order it online.

4.8kb is better. There is a 4.8kb soundcard driver for FlexNet. Soundcards
are even cheaper than YAMS, and come pre-assembled, ready to go.

>I know, none were actually built, although a few boxes of similar
>design were created by more than one group. Nothing comparable
>to the TNC-2 done since then.

I remember the NNC. In fact I can look to my right and see one
on a shelf right this minute. It is 64180 based, with 256 kb of static
memory, 2 floppy drives, and a SCSI port (which AFAIK no one
ever used). It has 4 HDLC ports, and a daughter board carrying
4 modems (alas, only 1200 baud).

Besides the units sent to software developers, 6 were sent
out for field tests. This is one of them. There were components
for another dozen which were never shipped. A friend of mine
has those. He got them when TAPR was selling off surplus
and obsolete inventory. (I don't know why, I suspect he just
wanted to corner the market on a bit of nostalgia.)

The NNC was a technical success, but it was the victim of
mass market economics. The one I have is still functional.
But the rapidly falling prices of PC clones made the NNC
an uneconomic choice for use as a network packet switch.

After careful consideration, GRAPES decided to deploy PC
clone based switches instead of using the NNC. PC clones
were about as cheap, and much easier to maintain in the field
because replacement parts were as near as the corner clone
store.

The NNC would have done the job for us then (though not after
we moved to 56 kb). But because the NNC was single sourced
in low volume, it wouldn't have been economic to maintain a large
scale high reliability network built around them.

TAPR couldn't have known when they started development of
the NNC that PC clone prices would plummet so quickly, and
so sharply. But they did, and that put an end to the NNC as a
viable network switch.

Hi All,

I am looking for a TNC that is small and capable. New or used. Price is not a big issue.

It must be able to handle HF and VHF an all or most modes.

If you have any suggestions or one for sale please let me know.

Thanks in advance.

Carlos

Let's make sure we're talking about the same problem; the TNC in the
Kenwoods will not send an ACK for an I-frame until prompted (via an incoming
frame with the Poll bit set) to do so by the "remote" DXE ?

Frankly, I think it's a very bad bug. It really kills the utility of the
Kenwood
radios as client nodes. I'd like Kenwood to acknowledge the problem and
offer me a fix for my still-under-warranty radio.

> My guess is if it's in the current version of the Kenwood radios, it'll be

That's very interesting. Someone actually admits this is a problem!
(it is, of course, but I get the impression Kenwood is looking the other
way). Alinco should absolutely refuse to ship radios with such broken
TNCs, or at least explicitly explain the issue to buyers.

Are you saying that 4.8Kbps will work with an unmodified radio? I
remember people running K9NGs with Mocom-70s at 4800bps - but I'm not
sure if they modified the beasties.

Anyway, the original question still stands - will 2400bps(or 4800bps)
work well with most radios, without modifications to the radio?

> There is a 4.8kb soundcard driver for FlexNet. Soundcards
> are even cheaper than YAMS, and come pre-assembled, ready to go.

Yes. But it would be pretty hard to fit a soundcard into my $150 Palm
mp100. However, you bring up a good point - I think some of these Palm
devices are starting to come with sound capabilities. But I think they
are only in the more expensive models($300+), and I'm not sure that
they have sound input capability.

From: Casey <casey@nospam.here>
Message-ID: <Wwav5.1523$_j1.15663511@tomcat.sk.sympatico.ca>
Source record: 11170

Hi Mark,

I find that using a an external DSP can be beneficial. My DSP 9+ has a fixed audio output which I use to feed the soundcard (previously PK-232). The filter allows me to reduce the back ground noise and/or band width. With the soundcard software you can see the resulting changes on the waterfall display. Also with the waterfall I can see where the filter is and move the desired signal, even with the narrowest band width.. I never found the DSP to be near as useful for digital mode when used with the PK-232. Being able to see where the desired signal is on the waterfall and scope displays make the difference in the usability

>TNCs, or at least explicitly explain the issue to buyers.

On the Dutch packet network, someone outlined a bug in the KISS P-Persist
mode. He claimed that the "persistance" value was implemented backwards,
i.e. a low persistence means a high probability to transmit, and a
persistance of 255 means the TNC/Transceiver will *never* transmit.

This makes it useless for Dama operation with software that sets the
persistance to 255 automatically.

Can anyone confirm that behaviour?

You would not operate it in KISS mode, but use a driver specific to the YAM
modem and the mode of operation you want.

CSS and GoList work together for the Dxer's benefit.

Muscle Shoals, Alabama. September 11, 2000: Creative Services Software announced that they have reached an agreement with The GoList to provide a bundled package of the Log Windows logging software and The GoList . The package will include the latest version of Log Windows and a one year subscription to The GoList

The Log Windows/GoList bundle retails for $119.95. It will also be part of the Digital Trio package from CSS, which retails for $189.95. Cross upgrades from release 3.06.50 or greater to the GoList subscription are $60. A cross upgrade for current GoList subscribers to Log Windows is $60.

Log Windows is owned by SCO, Inc and is maintained by Creative Services Software.

Creative Services Software is at http://www.cssincorp.com
The GoList is at http://www.golist.net
The Log Windows homepage is at http://www.logwindows.com
SCO, Inc is on the web at http://sco.home.mindspring.com/lw.html

Windows, Windows 95, Windows 98, Windows Me, Windows 2000 and Windows NT are Registered Trademarks of Microsoft Corporation.

>
> Yes, I understand the paragraph.

... Then you understand the mechanism by which the use of non-Ham links to
forward Amateur Packet Radio messages causes legitimate, Amateur Radio
digital messaging links to die away from lack of legitimate traffic? Right?

Running the non-Ham link intrudes on the enjoyment of the hobby by your
fellow Hams who ARE at least trying to use and so provide the opportunity to
advance the use of Radio.

Thousands of US Hams lost interest in Packet, largely due to the
introduction of "Internet Forwarding" of Amateur Packet Radio traffic. The
@WW stuff multiplied expotentially. Before Internet Forwarding, BBS SYSOPs
discussed the "heavy load" of @USA messages, not dreaming of the
artificially produced flood of @WW junk messages the "Internet Forwarders"
would soon pour into the network.

By engaging in this thoughtless, pointless activity, you, as a Ham, are then a LID, a Ham who operates in a fashion by which his fellow Hams are inconvenienced or prevented in their own enjoyment of the hobby.

You do it with non-Ham equipment, using commercial equipment and networks to undercut the work in that area (digital long haul distribution) done by Hams with Radio.

Your activities are stupid, rude, and pointless. You and your kind have set the US Packet network back, not brought it forward. Before "Internet Forwarding", the US provided leadership in the hobby. Since "Internet Forwarding", we have lost heart, dropped behind by over a decade while Hams in places that do not allow "Internet Forwarding" have pushed forward and developed both hardware and software far in advance of anything in the US. THEY got the high speed access, and REALLY high speed backbone links. Not US. - Thanks to you and those of your kind.

LandLine Lids

Source record: 11175

It's just so disconcerting to see conversations like this. It's pretty obvious that the "friendship and goodwill" portions of ham radio are now history. Why can't everyone just learn to live with others? If there's a repeater in your vicinity that is hooked to the Internet, and you don't like it, just don't use it. There a hundreds of different aspects of Amateur Radio, there's no rule that says that you have to do all of them or agree with all of them. There's many different drummers out there.

As to Internet repeater linking, lets step back a few years. There are/were quite a few repeaters taht have been linked using non-radio links. No one thought that this was bad. Automatic and manual phone patches have been a major part of Amateur Radio for years.Automatic phone patches have fallen in number, not because they are bad, but because cell-phone use has proliferated.

And as to using radio for all of the links in an "Amateur Radio" system, what about the connection between the microphone and the trasceiver? That's wired. Does that mean it's bad? Not to me. So why does hooking a few transceivers together with IP make it bad? What if by hooking up a lot of repeaters to IP, we could create a network that would allow you to roam across the US and still talk to the Amateurs in your home town. Would this be bad?

Let's look at ways that Amateur Radio and the Internet can enhance each other. There's been many QSO's made that couldn't be made before. Why? Did the Internet carry the signal? No, it's because it let two people meet each other and arranged a schedule for the QSO. The Internet is providing the capability for those who ARE working on new technologies to communicate with each other, like this thread originally was.

It just makes me sad to see that there are so many people who would rather sit here and call each other names than to get out and do something good. If you are into defending Amateur Radio so heavily, why aren't you out talking on it instead of hear cussing at others?

Ed

Were 9k6 modems ever developed for the NNC?

<chomp>

I have some pix, schematics, and source code for the alpha version of
that design. They are lurking in a file storage box somewhere around here.

There were a couple other architectures under consideration.

One had no floppy or hard drive support. I argued that floppy support
would be a "good thing" because it would make it easier to load firmware
compared to the serial port/parallel port schemes that were also considered.

The hardware design I liked best would have used a small rack type
box with a backplane and 4 - 12 slots for SBC card, modem cards,
floppy, and possible future extensions (e.g. ip router card). That design
didn't fly, looked too expensive.

As you pointed out, the availability of cheap PCs removed the need for
NNC hardware. However the software part of the project died along
with the hardware part. Had the software part of the project continued,
we might have had something different than NET/ROM as the common
L3/L4 protocol, and might have had native ip routing from the start.

There were a bunch of other netowrking projects that started about this
same time. TEXNET, ROSE, the Southern California effort (forgot names/calls).

Some of us would like to forward packet traffic over long haul links,
both on VHF/UHF and on HF. The folks who bypass those links
using the internet prevent us from doing so. They refuse to halt this
practice and allow the hams who *want* to use radio ... use radio.

Those are the folks who killed the "friendship and goodwill" .

Note that your "different drummers" are not drumming on radios ...

I am not "talking on it" because the traffic I wanted to handle over a long
haul
VHF link already got to it's destination via a link across the internet.

I am not "talking on it" right now because what I tried to do on HF
did not work due to the recent solar flare, and at this moment there
is no propagation to anywhere from the PNW.

I am not "talking on it" right now because the person I wish to talk
with on VHF has not left his office yet.

If you can't keep up, just say so.

We kept waiting for the high bandwidth network to appear. All we ever saw was 1200 and 300 baud. The BBS scrotum scratchers insisted on using AX.25 on HF, in the face of technical evidence against it. We put up our node, and waited. No other Ham group could be found to "interconnect", so we formed a better backbone on the big "Interconnect." It's still running today, although for the life of me, I don't know why. AX.25 Packet radio is dead. Voice and other digital HF modes have replaced it.

When you have to deal with idiots as an alternative, the Internet looks very inviting.

The Internet is where it is happening. The vocoder available from DVSI, and homebrew Speak Freely, allows repeaters to be interconnected and encrypted between nodes, to prevent outside access. Part 97 only allows encryption on satellite command channels, so many of the aux channels are easily jammed, which forces many repeater groups to use the internet.

Thanks Steve, that's interesting.

What about 2400bps? I remember that in the early 90's, a few of the TNC manufacturers started to market 2400bps TNCs - which pretty much took off like a Lead Zeppelin. In particular, I remember Kantronics had one, and it seemed to sell the most units. From what I can remember, they worked pretty well with stock, unmodified radios - but there was some kind of compatibility problem amongst the different TNC manufacturers.

I suppose those early 2400bps modems were AFSK modems, though. The YAM modem uses Manchester encoded FSK. Don't the pre-emphasis and de-emphasis circuts wreak havoc with an FSK signal(therefore the need for the discriminator/varactor taps)? Would it help at all that the signal was 2400bps FSK instead of 9600bps FSK?

I had a KPC-4 back then, and it did work (I seem to recall it being
QPSK). The problem was that 2400 wasn't worth the expense. The
speed increase was offset by the long latency times (most everyone
used simplex). Maybe if they made the data rate 2400, and sent
1200 with FEC through it, it might have improved some of the
long haul links.

I'm not sure why some people using the Internet prevent you from using long haul links. On my radio, I can talk on HF or VHF and not have any worry about what other people do.

And I certainly hope that you aren't talking about broadcasting packet messages across the US, that's a really inefficient use of spectrum.

But more importantly, it seems as if you are saying that Amateur Radio is slower than the Internet. Well, this just isn't true. If you are talking about the transfer of AX.25 packet data, then indeed, that mode is slower. But my radio signal is often many milliseconds ahead of an equivalent voice over IP solution.

But isn't it obvious that 1200 baud signals are significantly slower than 56kb and even faster connections? To compare the two is not a smart thing to do.

Ed

Ed, before you reply, it might be nice to read what you are about
to reply to, and perhaps even try and understand it.

> I'm not sure why some people using the Internet prevent you from using long
> haul links. On my radio, I can talk on HF or VHF and not have any worry
> about what other people do.

That is why I ask that you THINK ABOUT IT.

Here is what I said:

> > Some of us would like to forward packet traffic over long haul links,
> > both on VHF/UHF and on HF. The folks who bypass those links
> > using the internet prevent us from doing so. They refuse to halt this
> > practice and allow the hams who *want* to use radio ... use radio.

Do you understand the above paragraph?

> And I certainly hope that you aren't talking about broadcasting packet
> messages across the US, that's a really inefficient use of spectrum.

You use ham radio for what you want, I'll use it for what I want.

> But more importantly, it seems as if you are saying that Amateur Radio is
> slower than the Internet. Well, this just isn't true. If you are talking
> about the transfer of AX.25 packet data, then indeed, that mode is slower.
> But my radio signal is often many milliseconds ahead of an equivalent voice
> over IP solution.

Amateur radio is slower than the internet, for LONG HAUL links.

> But isn't it obvious that 1200 baud signals are significantly slower than
> 56kb and even faster connections? To compare the two is not a smart thing to
> do.

I did not compare them.

At least they were open and above-board about it. When the Land Line
Lids began to build the bypasses, more than one of them told me that
they intended to destroy the ability of the existing network to use long
haul ham radio links, and that there was nothing anyone could do about it.

Pretty expensive. Most repeaters need a club to share expenses and
get tower space donated. OKC had a non-profit corporation formed
for this purpose: (OPRA) Oklahoma Packet Radio Association. It got
about 3 members. Well anyway, money doesn't grow on trees, as
they say...

Or run cross-band. I don't know why more people didn't do this. It is
so simple AND cheap(at least if your not on some radio-active hill).
Gets rid of all those cavities and duplexers - and only adds the
expense of some extra feedline and a second antenna - both pretty cheap.

> QPSK).

I tried to do some web searches to find info on 2400bps packet ops. I came up with a big goose egg. The only thing that looked hopeful was some old mail archive index of packet information from 1991/92 that used to be stored at ftp.ucsd.edu (apparently some Brian Kantor-maintained stuff). The index is still reachable, but all the files seem to have been blown away.

KPC-4, huh. Well I knew that the KPC-2400 did 2400, but not the KPC-4.

QPSK, huh - that IS different. I sure would like to know the whole story. Looks like this is all lost technology. Even the TAPR back issues don't have much info - although I suppose the review of the KPC-2400 in Nov. '87 might be of some interest(at least it would verify whether it was FSK, AFSK, or QPSK).

> The problem was that 2400 wasn't worth the expense. The
> speed increase was offset by the long latency times (most everyone
> used simplex).

... and I would think the error rate would increase. It seems that 2400bps is right on the edge of what will work with most off-the-shelf, unmodified voice radios. In the lab, it probably worked OK, so these high-compression heads went ahead and tried to market it. So, the result was the proverbial "Lead Zeppelin".

> Maybe if they made the data rate 2400, and sent
> 1200 with FEC through it, it might have improved some of the
> long haul links.

Yes - THAT is a good idea. FEC... how about Interleaved Reed-Solomon?! You wouldn't even have to lower the data rate to 1200. Maybe just by 5-10%, or so. I've got a YAM modem coming. It comes with a Beta driver for the Manchester Coding FSK 2400bps implementation - but I would need to get the source code for it to implement the error correction. I'm entirely capable of doing this.

So there are some hams to want to do some things but they live at a large distance so they can not get it done their own. Now, there appears to live some hams at suitable places in between and their assistance would be helpful to get the link going. However, these hams are not interested of that kind of operations for some strange reasons. e.g. because it would just be hard work and no pleasure for these intermediate hams. Now, the original hams call these hams with all kinds of names because these hams in between don't want to play in the sandbox exactly as the original hams wanted.

>The folks who bypass those links
>using the internet prevent us from doing so.

Do these take away all to frequencies or the good sites, thus preventing some radio only connection ?

From the discussion so far, it appears that the reason for this name calling is that other hams refuse to provide the intermediate relay stations that would enable the original hams to play just the way they wanted.

>They refuse to halt this
>practice and allow the hams who *want* to use radio ... use radio.

As far as understand, you are still free to set up and maintain your own relay stations in more ore less inaccessible places, why don't you do it yourself ?

>Those are the folks who killed the "friendship and goodwill" .

Requesting others do devote all their free time to do things that they are not interested in, just to please some other hams and let them play exactly as they please without considering others, is quite a broad definition for "friendship and goodwill" :-).

HAPN 4800 bps works OK without modifications to the radio, just connections
to it.
(i.e. you don't need to modify PLL time constants, filter bandwidths, etc)

Here is where you make a fool of yourself. If the link does not exist,
NO ONE can "bypass" it. And if the link exists, having someone else
bypass it does not have any effect on your ability to use it. Any
traffic siphoned off by this alleged "bypassing" only leaves more
spectrum available for you to use.

>>> They refuse to halt this practice and allow the hams who *want*

>
> You use ham radio for what you want, I'll use it for what I want.

Yeah, right. Isn't that what the repeater jammers always say. And the
folks who want to hold a local QSO on a long established net frequency?
And the lids on both sides of the maritime phone patch debate? Of

course you can "use ham radio" for whatever you want -- at least until the FCC figures out a way to enforce "good amateur practice."

I don't believe that long haul packet is necessarily abusive, but I do have to agree that it IS (at best) "inefficient use of spectrum" -- I also know that SOME packet traffic handlers have CHOSEN to be abusive, but of course I assume you don't support that.

>> But more importantly, it seems as if you are saying that Amateur

>
> Amateur radio is slower than the internet, for LONG HAUL links.

True. And inefficient. And unreliable. And expensive. But who cares as long as you get to use amateur radio any way you want to.

But why do you think that the mere existence of a quicker, more efficient, more reliable, cheaper way to send the same traffic somehow prevents you from using the slower, inefficient, unreliable, expensive method of your choice? Could it be that you are not really talking about what YOU can or can't do, but rather arguing about that someone else should not have the same right to "do it their way"? Could it be that these bypassed links that you are whining about are no where near your station and you have no connection to them -- so you are simply whining about how someone else chooses to pass traffic at his station? You sound like a diehard CW operator complaining because someone else far down the line passed one of "his" messages on phone instead of keeping it pure "CW" all the way from origin to delivery.

If you want to keep your traffic pure and unsullied by the evil internet, find enough like-minded people and establish your own routings. Nothing makes you route traffic into an internet gateway. Nothing makes you route traffic to a station that you know is going to route it through a gateway. If you would rather have your traffic garbled and lost to protect it from being tainted by those dreaded wires, then you need to route your traffic to someone who will love and cherish it like you do - someone who would rather destroy it than deliver it. But while you are at it, don't forget to set up a system for handling the volume of service message traffic back to the originators informing them that their traffic died enroute.

And, NO, I am not one of the people running (or even using) a gateway to the internet. I'm just a ham who thinks I should be able to use amateur radio the way I want to (within regulation and good amateur practice) without someone else trying to limit MY choices of how I use MY station.

Wow, talk about selective editing. How about you go back and re-read
the entire paragraph shithead.

Here's the rest of the paragraph:

We put up our node, and waited. No other Ham group
could be found to "interconnect", ...

What you're saying is we should have built the entire network. That's
not how it's done. Without an investment in the system, it has no
value.

>
>Were 9k6 modems ever developed for the NNC?

Not specifically. The modem daughter board connects to the HDLC
ports with ribbon cables which have the normal TAPR modem disconnect
pin out, though, so it is no big deal to fit separate 9.6 kb modems to the
NNC. I had a couple of G3RUH modems hooked to mine at one time to
form a 1200/9600 cross connect. Of course I had to fabricate a way of
mounting them in the box. I removed one of the floppy drives and put them
in that space.

The NNC could keep up with one 56 kb modem, but not two. That's about
on a par with the 12 MHz 286 PCs we used as our first switches. The 64180
is a super Z80, and quite efficient compared to the PC architecture. We had
to go to 386 PCs (motherboard transplant) to handle multiple 56 kb modems.
The NNC could never have been upgraded to handle that. Some of those
original transplant 386 switches are still in service.

As I recall, 2400 bps was done with a 600 baud AFSK signal, same as
1200 bps, but with 4 level modulation instead of the 2 level modulation
used for 1200 bps. So the radios would pass it just fine, but the path
had to have a better SNR to maintain the same error rate. Since lots
of amateur paths in use were marginal, this was a problem.

But the big problem was that only Kantronics produced a TNC to do
2400 bps. This sort of single sourcing has caused many otherwise
technically sound developments to not gain large scale amateur
acceptance as network components. Amateurs are rightly fearful
of winding up with an unsupportable orphan. If a couple of the other
manufacturers had jumped on the 2400 bandwagon, it might have
supplanted 1200 as the basic AFSK packet speed.

As someone pointed out, the improvement in throughput of 2400
over 1200 is small because the turn around latency is still large
for a system intended to use a FM voice grade radio. 9600 was
much better primarily because it forced amateurs to use purpose
built data radios (the TEKK, and similar) which also offered the
quick TR and rapid receiver recovery necessary to see the benefit
of the higher speed. (Those who persisted in trying to shove 9600
through voice grade FM radios were disappointed with it too.)

Try reading what I wrote.
I like to build long haul links.
There is no "middle" involved.
There are only two ends.

> >The folks who bypass those links
> >using the internet prevent us from doing so.
>
> Do these take away all to frequencies or the good sites, thus

Please think about the issue.
It is not possible to pass traffic to someone when that trafffic
has *already* been passed to them, against their wishes, over the internet.

> From the discussion so far, it appears that the reason for this name
> calling is that other hams refuse to provide the intermediate relay

Totally wrong.
Please read what was written.

The above statement is why I asked you to think about it.

The level of ignorance shown here is one of the several reasons we
no longer have an RF based store and forward network.

>
> Do you understand the above paragraph?

Yes, I understand the paragraph. I also know that I designed and implemented a CONUS network for another service using packet radio. I've done quite a bit of long haul relay myself. I also know that long haul relay using VHF/UHF is for the birds. It can take days to send something across the continent. And on HF it's not much better. A single channel can only pass a few messages per hour, and unless you are using something like ALE, you have a very small window in which to transmit anyway.

But, as I and others have said, there is nothing stopping you from doing what you want to do, except that there might not be any users that want to use your services. And in that case you are just going to have to learn to live with it. You, know, there really isn't much call for commercial telegraph operators any more. Sometimes technology just passes people aside.

Also, you might want to look at refocusing your services to something that your capabilities better fit. Amateur Packet protocols aren't going to compete with speed of bulk transfer, so just live with it. But maybe they can compete during disasters or into areas not well served by high-speed connectivity. Smaller islands, remote wildernesses, and boats at sea still have need for connectivity that you might be able to assist with.

Sometimes you just have to learn to change when the environment changes. Amateur Packet Radio is a pretty old concept at this point, at least 15 years if I remember correctly. That's a long time for a data service to be in existence.

> > And I certainly hope that you aren't talking about broadcasting packet

Absolutely right! So when someone comes up using for something that they want, don't criticise them for it.

It's also slower for short-haul. I'm connected at 1MB+ speeds, that's about 20 times faster than just about any protocol in use in the Amateur spectrum.

> > But isn't it obvious that 1200 baud signals are significantly slower than
> > 56kb and even faster connections? To compare the two is not a smart thing to
> > do.
>
> I did not compare them.
>

Yes, you did. Amateur vs Internet. 1200 vs 56kb. People aren't using the Internet just to thumb their noses at Amateur Radio. People are using the Internet because it provides the capabilities desired. 56kb is considered about the slowest link that you would want to use on the Internet, it's the fastest link in Amateur Radio!

Don't forget that this thread is about linking VOICE repeaters together. It wasn't about Packet Radio at all!

<snarf>

The one thing I disagree with. No problem at all handling all that data over
HF and over long haul VHF/UHF links. I'm doing it now, to the *one*
remaining place in the USA that is not bypassed by the internet. Doing
it on HF as a matter of fact, at this very instant, on 15M, with a sustained
data rate of 360 bps. Conditions are poor, the link usually runs at 750 bps.

Of course all this data *already arrived* at the BBS *adjacent* to the
one I forward with, over the internet, because the internet can beat
the several minute delay involved in the HF protocols.

The "anti-radio" folks appear to be pretty much clueless about all these
issues Charles. Gaining the knowledge of what actually has been done
in the past, and what has been done in other parts of the world, and
what could be done here ... is too much work for them. They take the
lazy non-ham way out, and pretend to be "involved with the hobby."

Are you only talking about the Mocom-70 here, or basically ALL
unmodified general-purpose commercial voice radios?

The HAPN-T 4800 baud Modem - doesn't that stand for Hamilton Area
Packet Network? What kind of modulation does/did it use? I found some
dutch site about Manchester modems, which showed a scope trace of a
typical HAPN-coded signal - it looks a bit like Manchester encoding:

http://www.dutch.nl/bdj/manmodnl.htm

What's the theory here? That Manchester encoding has a better chance
to work with commercial voice-grade radios at 2400bps? Is that why the
YAM modem uses Manchester encoded FSK at 2400bps? I've been trying to
get information on how this work is proceding, and I'm trying to get a
copy of the YAM 2400bps driver for Linux. If this is working out, I
wouldn't mind adding Interleaved Reed-Solomon Error Correction to the
YAM 2400bps driver - I bet that would also help.

> A lot of posters to this group seem to have severe reading
> comprehension problems.
>

Or maybe you have some problems getting your point across?

A) This thread was originally about linking VOICE repeaters. You muddied it up talking about packet data.

B) You seem upset that no one wants the services that you want to provide. Long discussion aside, if the service that you want to provide isn't needed, then it isn't needed. As in the business world, if no one wants to buy your product, it's pretty hard to sell it.

C) There are still many places where the Internet doesn't reach. So there have to be some opportunities to provide transport of information. You might have to work to find them, or to create them, but they are there.

D) As someone who has played in the long and short haul packet game for years, I know just how little data that I actually moved (or could move for that matter). It wasn't much. A 4kb message would choke the system for days. At about 5 minutes per hop, sending it to 20 other stations would take hours.

Hank, you just might have to reconcile yourself to the fact that your favorite aspect of the hobby is no longer feasible. Like those who really enjoyed building spark-gap transmitters, other new-fangled solutions can make things obsolete. I also know that under the best of circumstances, Amateur Packet Radio could not even think about delivering the content of just this forum, albeit the dozens more that exist. There's also a slight question about content legality that comes into play.

In the long run, I think that it's going to be Hank against over a 100 million Internet users. Be reasonable, which one do you think will win?

Ed

Are we talking about 1200 bps used in amateur packet radio? I'm confused by something, help me understand what it is. 1200bps amateur packet uses Bell 202, which encodes 1 bit per baud, making it a 1200 baud AFSK signal as far as I can tell. 2400bps could be done with a 1200 baud signal

that encodes 2 bits per baud. What does 600 baud have to do with either? I've always thought a two-level code means that two discrete values are encoded, which is represented by 1 bit, and a four-level code means that four discrete values are encoded, which is represented by 2 bits. What am I overlooking?

Source record: 11059

Several Minutes? Your 360 bps equates to use over 100 KB per hour or about 3MB per day, one way. I transfer that amount of data in about 15 seconds from my connection to the Internet. If I am up for 3 hours, I can transfer more than you can in THREE years of 24 hours per day continuous throughput. Now, if we move to reality, you probably can get your 360bps for only about 6 hours per day, maybe 8, that's less than 1MB per day.

We really are talking apples and oranges here.

PLUS, you are trying to provide a service. Therefore you have users. Do you users want longer or slower delivery? Or do they want delivery "through Hank"?

Okay, so what if the circuits to the Internet fail and the current "faster than Hank" paths go out of service? Well, then you are there to provide a service. I just hope that people don't try to send more than 1MB per day! But on the other hand, after studying this subject in-depth, the probability of a disaster occurring that would cause long haul circuits in the US to be needed is just about zero. Short haul is much higher, but long haul is extremely small. I don't think that we have ever had the situation where large parts of the country couldn't talk to each other.

Oh, and before you start with California earthquake things, don't forget that the Internet has proven itself during every disaster that we have had in the US, and most other countries. I've done disaster relief for hurricanes where I've had Internet access at facilities that the eye of the hurricane passed over.

>unmodified general-purpose commercial voice radios?

The HAPN 4800 baud modem can operate with both FM and PM transceivers,
and has no requirement for near-DC response of the modulation.

Therefore it works with any transceiver that allows connections to the
modulator and discriminator, whereas the 9600 baud FSK modems need
response near DC and thus are unusable on PM transmitters, and transmitters
that modulate a VCO inside a PLL.

>The HAPN-T 4800 baud Modem - doesn't that stand for Hamilton Area
>Packet Network? What kind of modulation does/did it use? I found some
>dutch site about Manchester modems, which showed a scope trace of a
>typical HAPN-coded signal - it looks a bit like Manchester encoding:

>http://www.dutch.nl/bdj/manmodnl.htm

>What's the theory here? That Manchester encoding has a better chance

It uses a 3-valued FSK system. I forgot the name by which it is known in
the telecom world. The transmitter is on the center frequency between
bits, and makes a short excursion to one direction for a 0->1 bit change,
and in the other direction for a 1->0 bit change. Thus there is no DC
content (the number of 0->1 and 1->0 transitions is always the same, no
matter what the data is).

The HAPN design uses no scrambler, it just sends the usual NRZI data.
No manchester coding is involved, but indeed there are similarities.
A design with a scrambler was also made by a Belgian ham, but it is much
less widespread.

HAPN indeed stands for Hamilton Area Packet Network, the designers of
this modem. It was published in the august 1988 edition of Ham Radio,
and many different implementations (with different digital interfaces
and additional circuitry like 1200/4800 switching) appeared in the
Netherlands, where it has been the defacto standard faster-than-1200 modem
for a decade. Now that homebrewing is dead and off-the-shelf availability
takes precedence over bit-error-rate considerations, the G3RUH-derived
modems, usually used with unsuitable transceivers, have taken over.

Your participation would be most welcome.

We have PACTOR, PACTOR-II and CLOVER systems on air
in the Portland/Vancouver area. There are several PACTOR-II
systems north of us (Washington and British Columbia). Three
CLOVER systems in California. Always looking for more links.

Westnet is still alive and well ... at least for long haul links.

WESTERN CONNECTICUT HAMFEST
Sponsored by: Candlewood Amateur Radio Association - CARA
http://www.danbury.org/cara/

Sunday, September 17, 2000
Edmond Town Hall, Route 25, Newtown, CT Exit 10 off of I-84

Admission $4.00, Kids Under 12 Free.
Table Set-up at 7:00 AM.
Tables $10.00 Tailgating $6.00. (Both include 1 admission).

Commercial vendors include West Mountain Radio (the RigBlaster
folks), KJI Electronics Inc. and Signs by Ron.

ARRL Sanctioned. Talk-in on 146.67 (-) PL 100.0. Handicapped Access.
Ham Radio Equipment. Computers. Door Prizes. Refreshments.
Ample Parking. Rain or shine.

Only 12 minutes from Brewster, 15 minutes from Waterbury.

For information call: (203) 798 2831 (914) 831 3124 or (203) 743 9181

-------------- Table Reservation ----------------
Mail to: Candlewood Amateur Radio Association (CARA) Hamfest
P.O. Box 3441,
Danbury, CT. 06813-3441

Name:_____
Address:_____
City/State:_____

Please reserve _____ tables at $10.00 each.

And I've delivered 35,000 message in 4 hours across the Internet. And that's message about 10k long. To destinations around the world. And the server or circuits weren't working hard.

And that is the issue!

The Amateur Packet System showed most folks, years ago, that it was not capable of handling the amount of traffic that was needed of it. And nothing has been done to make the situation better. Maybe some protocols have been tweaked to double the effective throughput, but we're talking orders of magnitude that are needed for packet to be competitive.

Oh, and in Loma Prieta, the Internet was still active and handle significantly larger number of messages than 6,000.

Oh, and in your 1357 message, was the total data transferred? I'll guess most messages to be less than 500 bytes and with a few R: headers, average size would be about 1k. If you were to look at the numbers that I presented, a 4k message to 20 stations, that would represent a total transfer of 80k. If my guess of your 1k message size is close to correct, that then indicates that you transferred 1357k. At your fastest rate, that would then indicate that 80k would take about 1.4 hours to be sent. While maybe "hours" wouldn't be a good description, it's not that far off.

Hank, if Internet forwarding is so bad, then how come your customers aren't yelling and why are the other forwarding stations doing it?

Ed

Chris,

There's definitely a lot that you can do. I would suggest that as Hank suggested, that you do visit the TAPR site and their forums, as well as any of the APRS information sources on the Internet. You might also look for some folks in your local area to work with.

Do you have any idea how silly that sounds?

Perhaps you could compare ham radio to the US Post Office,
or FedEx, or UPS, or a Volkswagen full of DAT tapes.

And then whine about how we should abandon ham radio because
it cannot deliver as much data across town as a VW full of DAT tapes.

>

Presuming that you mean "publish", and not "broadcast", you
can use any number of different applications to provide an
RF<->Internet gateway. Under Linux, for example, you can use
the aprsd package (available at www.wa4dsy.radio.org) to
do just that.

There is an extensive system of APRS internet servers
already in place. For example, you can go to my site,
http://mulvey.dyndns.com/aprs to see one in action, with a
Java applet (written by Steve Dimse) to allow viewing
of Western NY data & maps. You can also get just the
data feed by telneting to port 14579.

As for publishing everything from the net to RF - only
if you intend to piss off a lot of people in a very short time.
Try telneting to first.aprs.net, port 1313, to find out why -
there is a HUGE amount of APRS data being passed around on the
net, and a 1200bps channel would fold up and die with a full
feed.

>I am starting from scratch, and have no information on this subject.
>Any help, direction, web sites,lieteture, guidance, etc...would be
>most appreciated.

Join the various APRS lists at www.tapr.org. They're a good
jumping off point.

- Rich

"... be competetive." With what? RTTY? PSK31? Morse?
Explain what radio protocols and networking you are talking about.

> Oh, and in Loma Prieta, the Internet was still active and handle
> significantly larger number of messages than 6,000.

My wife was at work at Seagate Technology in Scotts Valley when the
quake occured. There was no dialtone in Scotts Valley. When she reached
our house about 2 miles away, there was dialtone and she called me.
The line dropped a few minutes later, and stayed out for 3 days.
The internet handled zero messages during that time.

In the Marina there were no functional telephones for several days after
the quake. There were two mobile packet systems however, set up in
vans that went from shelter to shelter handling health and welfare. That
traffic went out on HF via N6VV.

Your guess is wrong. Try again. You are not even close.

As with most of the Land Line Lids, you don't seem to have a clue how
much traffic can be, and has been, moved over HF links and long haul
VHF/UHF links. Your "guesses" are simply silly propaganda.

If you want the real numbers, you can retrieve the log files collected
by the ARRL and analyze them yourself.

> Hank, if Internet forwarding is so bad, then how come your customers aren't
> yelling and why are the other forwarding stations doing it?

I don't have "customers". It is the internet that is a business, not ham radio.

The following quoted verbatim:

To the S.C.D.C.C. and other interested parties......
...an open letter to Jim, N6HNY, who runs the SCDCC re-mailer
on Internet

I want to advise you about the danger of following the advice
of certain "techno-nerds" who are promoting the idea that ham
radio must become an extension of Internet and provide access to
that medium. Beware of where they're leading you! Their ideas are
flawed, and tend to undermine the concept of what ham radio is
all about. I'm talking specifically, about one or two people who
are trying to convince the SCDCC and a repeater owner to
establish a 9600 baud duplex packet repeater. Having just that,
is one thing, but their "hidden agenda" is to have a duplex
repeater with a connection to Internet and/or conference bridges
all over the world. A sort of "free access" to the Internet, if
you will. Well, I have drawn a line in the sand, with regard to
Ham radio and Internet, and I think you need to as well. I am
in agreement with Hank, W0RLI, and people who think as we do. I
understand that the entire Pacific Northwest has taken a stand
against forwarding via Internet, and I am with them!!! It is no
contest when you compare the speed and volume of traffic that
W6VIO (the BBS of Jet Propulsion Laboratories) can handle, when
compared with the K6VE BBS, or other BBS's without an Internet
connection. W6VIO wins "hands down!". But, W6VIO relies almost
entirely upon Internet forwarding to accomplish it's goal to get
traffic where it needs to go. What's the point? To kill ham
radio?
At the last SCAPS meeting (sorry you missed it, Jim), the
SYSOPS took the first step towards assuring the fact that the HAM
RADIO network can and will handle HAM RADIO messages. Files,
simply copied from Internet or other sources, are no longer
mandatory baggage in the #SOCA and #CENCA portions of WESTNET!!!
In other words, if you want to learn how to make fudge brownies,
check out the Internet, but if you want to send a message (or a

bulletin that's authored by a ham about a topic that's relevant to hams), then check in to your local Westnet BBS!!! The SYSOPS do not consider their individual refusal to post and/or forward such bulletins as censorship, as they're available to any sysop who wants them, from the Internet! If you want to send out a 35 page manual, then you'd better be prepared to put it on disk and get it out via means other than Ham Radio!!! Of course, you can use ham radio to notify hams that the information you have is available, and some sysops might even want to post such data in their BBS files which may be available for LOCAL DOWNLOADS during "off-peak" hours. If, on the other hand, you want to send a message independent of commercial circuits, then HAM RADIO is your best choice. Hopefully, in the event of a disaster, HAM RADIO will be there to help. My sysop told me that sending a 38 page manual via ham radio is like carrying a pile of lumber in the family car! It's not meant for that purpose! THINK ABOUT THAT! Ham radio cannot compete with Internet, nor should it have to! Ham radio does it's best job in emergencies, when it's not required to send recipes and similar bulletins "ad nauseum". Ham radio doesn't have to compete with Internet; it just has to GET THROUGH, and not a lot of data at that! If most people want the ease and reliability of a 1200 baud connection to their local BBS, that's fine. What is most important is that they have a reliable and workable connection and that they have a RADIO STATION that's capable of operating from their home or place of employment, to assist others in case of a disaster. IT ISN'T IMPORTANT THAT THEY BE ABLE TO SEND 15,000+ RECIPES FOR DIABETIC POUND CAKE, just that they send the words "HELP...need medical supplies as follows...etc." It's absolutely crucial that we have as many HAMS as possible, and not that they have the fastest technology on the planet. It's better to have more hams with 300 or 1200 baud equipment than it is to have a few hams with 9600 baud communications tied to a single repeater with a port to the internet! Talk about putting all your eggs in one basket! That just doesn't make sense! The ham radio network that we have in place right now, works very well for what it needs to do now, and in the event of an emergency. That's what is important. If you want to do something good for ham radio, get the word out to everyone that YOU CAN BE A VALUABLE PART OF AN EMERGENCY COMMUNICATIONS NETWORK, and not the current pitch of offering free access to the Internet or worldwide conference bridges at 9600 baud or greater speeds via a "free" ham radio duplex repeater.

> My wife was at work at Seagate Technology in Scotts Valley when the
> quake occured. There was no dialtone in Scotts Valley.

The recent fire in Los Alamos was a similar example. The Information Systems manager for the county needed to link all the fire departments together, and sent out a request for proposals on a new system. He found that a wireless system was actually cheaper than the T-1 based system proposed by another proposal.

Turns out during the fire, that the phone system was dead (shut down to prevent damage during the fire). If he had relied on a T-1 based solution, he would have had zero communications.

What this shows, is that a lot of technology has matured since the quake you mention.

The object isn't one of handling 6000 messages, it is one of on-line communications, both voice and data. The wireless networks available today only have to reach the next point into the national network.

FEMA often provides this service now, by rolling in a Satcomm truck and hooking in to whatever infrastructure you have left. They also provide a telephone tent which is used as a command center or citizen access to call outside the disaster area, via the Satcomm link. They have access to NCIC and all the channels you need to run a city, just like before the disaster.

If you really want to have an impact, develop a wireless solution in your community. Hams know how to do this, as it involves antennas, coax, lightning protection, solar power, and radio towers. With new rules in hand, Hams can now do high power spread spectrum, that can blow away anything done under Part-15 of the CFR.

Forget about a low-baud HF link to a point 2000 miles away, and concentrate on developing a megabit link to the next town, or up to a peak with a solar powered relay site to the next town, etc.

Steve

That's absolutely correct and I'm very glad someone brought it up. If you make a tcpip connection in WinAPRS just for your own observation purposes, you'll find in just a few minutes that you have accumulated 3,000 stations from around world. Not only would it flood the RF side of things to the point of it not being able to keep up with the internet traffic alone, but none of the stations on the RF side will ever get a chance to be heard. You'll also find that the majority of folks on the RF side don't care to see someone motoring around in Atlanta or LA, or to see two guys in Texas sending one-liners to each other, if they're in a completely different part of the country. I-gate stations need to be coordinated within the RF network area that you are located, and it is very important that proper parameters are established to allow only that traffic intended for your geographical area to be passed onto the RF side. It's great to see Chris have the desire to participate and promote interest in APRS. Just be sure to check with the experienced locals or an area coordinator before getting an I-gate or wide-area digipeater going.

>
> Out of band mods, and scrotum scratchings from Brazil and West Africa?

Yes, all that and more! The message content is determined by the thousands of Hams who send those messages. It's not really any of your business, unless a specific message is addressed directly to you.

>
> Ham radio is a real-time communications medium. The stored message
> with email like features has been a complete failure.
>

Nope. It's working just fine - Where "LandLine Lids" such as yourself are legally restrained from vandalizing the system.

> Get over it.

Don't worry; We (Hams who use Radio) will "get over it"... With the US as a great example of the damage that "Amateur Telephone" does and with Europe as a great example of what can be accomplished when "Amateur Telephone" is outlawed, new, effective regulation of "Amateur Telephone" activity here in the states is pretty well inevitable. The issue is getting International attention, and not just on these news groups. The "movers and shakers" are starting to wake up and smell the coffee.

That's the right approach, and since the "LandLine Lid" types have made it apparent that nothing short of new regulation will stop them from disrupting the hobby, we are not left with much choice except to regulate their activities, ENFORCING the common decency and regard for their fellow Hams that they lack within themselves.

I've suggested a way to beat that speed for distribution of "across the
country" several times, and even did a brief on the air test. I didn't get
much feedback, and assumed a lack of interest... Are you interested? - Or
just shooting your mouth off?

hello all,
i am a newbie, so please excuse.
i just bought a radio shack 10m rig (htx-10).
is there a way to hook the mike up to my pc
to work psk31 ?
if so, what are the popular freqs for 10m psk31 (if any).
no other hf in the shack, yet.
please reply directly to me, as i don't read newsgroups very often.
thanks,

Using the link for solely transferring of (near realtime) very short
messages at irregular intervals will provide a useful service e.g. for
DX-cluster and APRS messages. Such data usually becomes obsolete in a
few minutes, but with lightly loaded links, the data will get through
in a few seconds.

Such constantly on-line message transfers are a very useful for such
end users that only have long distance dial-up or cellular phone data
connections to the telecommunication infrastructure and thus can not
keep the connection constantly on line, in which case the radio
solution would be preferable (competitive).

However, trying to run bulletin store and forwarding over such radio
links will very easily destroy the only advantage such links have,
i.e. the moderately low latency times of the long haul links, thus
making the link more or less useless for DX-cluster and APRS type near
realtime applications.

Some low volume private mail transfer could be transferred e.g. by
padding some very short real time messages with mail bytes since most
of the air time would be taken by Rx/Tx turnaround delays anyway.

Apart from very specific applications, bulletin store and forwarding
is a dead horse, no need to beat it anymore.

>Nonesense.

While the above numbers may be a bit exaggerated, it is certainly true that
the original forwarding protocol used by W0RLI, WA7MBL and AA6RE systems
had serious flaws in both the protocol and the implementation, causing
behaviour like the above.

It also meant that sysops invented all kinds of limitations to avoid being
hit by these problems, including "defining" size limits for local, region
and world traffic, and flaming senders for going over these limits.

As the defined size limits were not widely known, and not the same in every
region (they of course depended on the quality of the local infrastructure),
it could easily happen that one sent a message from the Netherlands @EU,
and then get flames back from UK sysops (those were the nastiest) about
the unacceptability of "messages as large as 10KB".

Of course, with the advent of F6FBB's BBS and the more advanced forwarding
protocol it introduced, these worries were mostly a thing of the past.

Charles,

I'd have to disagree with your interpretation of history. My experiences show that Amateur Packet Radio died because of a lack of interest. The @USA messages had killed packet radio well before @ww ever appeared. Reading hundreds of "for sale" messages just wasn't that interesting.
Packet never really had it's "killer app", the app that makes everyone want to use it. Most folks that I knew got a TNC, tried it for a little bit and then put it on the shelf. There just wasn't a compelling reason to use it.

The closest that has come to the "killer app" for packet is APRS, but it's more of a niche application than a mainstream one.

What's sad is that Packet Radio represented an excellent opportunity for Amateur Radio to assist others, but very few people did anything to move it forward. As far as I know, there were probably less than a dozen applications that use Packet Radio, BBS, APRS, DXCluster represent the majority of use. But there were many others that could have been created, but so few Amateurs seem to be in "creating" things any more. I created an application that we've used at the Annual Peachtree Road Race for about 10 years, coordinating the medical tents and Lost & Found. There was one other that I knew of that assisted ARES operations, but that's about it.

But after 10 years of 1200 bps data transfer, I'm looking for a replacement so that we can provide our customers with a higher level of service. 2400 doesn't help, neither would 9600. 56k is the minimal solution that we are looking at. And the DSY modem isn't a solution because it's too bulky and expensive. the only solutions that are surfacing are the 802.11 wireless cards. 11 Mbps gives us some possibilities that don't exist at 1200 bps.

I have a very hi-profile packet station, running APRS. The computer that controls the TNC, has an active 100 base-T network connection. I can get a static IP if need be.

What I want to do, is "broadcast" all the RF (APRS) data to the internet...and gather all the internet (APRS) data, and "broadcast" it to the RF side.

I am starting from scratch, and have no information on this subject. Any help, direction, web sites,lieteture, guidance, etc...would be most appreciated.

Thanks much,

Chris

While I'll agree that RST is outdated, of all of it's indicators, T is probably the best fitted to PSK31. The "tone" relates to the spectral purity of the transmitted signal. and the purity of the signal is very important to the PSK31 signal. The T probably could even be directly connected to the IMD of the transmitted signal.

R, as readability is either 5 or 0 either you are decoding the signal or not.
S, the signal is still important, but in the digital world it has been replaced by the BER, Bit Error Rate.

Chris,

While TCP/IP supports broadcasts, the Internet does not. There is a
permutation called multi-cast that is close, but it also isn't widely
supported. So, to do what you want, you will have to use transmissions to
all systems that you want to send or receive data from . UDP would probably
be the protocol that you would use.

Ed, I suspect your mind is made up, and you will refuse to read anything
that disagrees with your anti-radio position. I'm not posting this to try and
convince you of anything. But there are others who might have the interest
and capability of understanding the issues. I quote the following verbatim:

KF6QDP wrote to LLL on Sat Apr 11 22:48:53 1998:

> In summary, although I would like to see high-speed ham radio
> data networks, I do accept the fact that the internet is here to
> stay. We should try to integrate this new technology and not
> alienate its users.

Bruno --- "INTEGRATE" is the key word. Unfortunately, in MOST
cases, the internet is not being integrated with the radio network,
it is REPLACING the radio network.

It would be great if the internet were being used as a RESOURCE,
rather than a VEHICLE. Here is a simple example:

Many sysops around the country have callbook servers running
on their system. If you are lucky enough to be able to connect to
one of them, you can directly query the database for names, addresses,
etc. If you live a little further away, you can send a message to the
server, and get your information back in the form of a return message.

Right now, those callbook databases are residing on the sysop's
hard drive. At best, most of them are usually updated on a quarterly
basis. If, instead of accessing a "quarterly update" on the hard drive,
the callbook server would access one of the callsign databases on the
internet, you could have access to a database updated on a daily basis!
Wouldn't that be nice? It would certainly free up considerable space on
sysop harddrives around the country, too!

The same thing could be done for radio mods, antenna designs,
and a "zillion" other topics which currently reside on the hard drives

of sysops all around the world. The internet would then be used as an information resource to provide ADDITIONAL services to the packet community, not as a vehicle to transport all the messages between amateurs.

Unfortunately, in most cases this is NOT what is being done.
Instead of ADDING TO packet radio, many unimaginative and uncreative (and yes, probably "lazy" too) operators are using internet resources to REPLACE the radio part of the equation. The only "radio" part they are leaving is from the individual packet user to the local BBS. In many cases, they are even providing landline connections to the local BBS, so radio isn't even needed there!!!!!

Stop and think about this for a minute. What they are actually doing is becoming third-rate, imitation, internet service providers themselves! Yet, they can't measure up to even the free e-mail only providers like Juno.

The only thing these people offer to packet radio is a little more speed in forwarding messages over longer distances. But at what price do we achieve the speed? As more and more forwarding is done via the internet, there is no reason for radio networks to be built or maintained. After all, the internet is faster, easier and cheaper to use than a long-haul radio network.

As the radio network disappears, so does the prime justification for continuance of the amateur radio service. When you cut through all the window-dressing, the only reason governments around the world allow the continued existence of amateur radio is that we represent a "FREE" backup communication resource for them to use in times of disaster or war ..... when "usual" lines of communication are out of operation. "Usual" these days tends to mean internet or other landline means. So, if we become dependent upon the internet to maintain our "packet network", how are we going to be able to offer an alternate means of communications when the telephone lines and the internet fail?

What the multitude of governmental agencies expect the amateur community to be able to provide these days is far more than can be handled by the National Traffic System alone. It requires the existence of a Digital network as well. Without a Digital RADIO network, we simply can't handle the job. When the government realizes we can't handle the job for them anymore, just watch how fast those frequency allocations go up for sale!!!!!!

So lets stop the forwarding of packet messages by internet.
Let's maintain and increase our radio network for the TRANSPORT of messages. Let's INTEGRATE the technology by using the internet as a vast assemblage of data resources, not as a REPLACEMENT for radio forwarding.

> Radio. I find many other facets of the service to participate in.

Ed, I suspect your mind is made up, and you will refuse to read anything
that disagrees with your anti-radio position. I'm not posting this to try and
convince you of anything. But there are others who might have the interest
and capability of understanding the issues. I quote the following verbatim:

W1UU wrote to WB1DSW on Fri Nov 13 09:44:06 1998:

> Good morning, Herb.
> This is getting interesting! But I am more than pleased the discussion
> isn't nasty. I have been reading the DEBATE information from and to
several
> people, so I am getting a sense of what you are telling me.

Peter -
Again, I'm not buying any of it!
Let me be absolutely blunt clear and to the point - so that you can "get the
sense of what" I am telling you. Telephone forwarding is for the folks
who have abandoned amateur radio. If you want to be included in that
bunch, too bad.

>
> >Well I've had enough time now to digest what you said the other day.
Needless
> >to say, I'm sorry, but I don't find much to agree with.
>
> You stated a premise to me. I went into some detail about some of my
radio
> only solutions. I don't know if you disagree with some of my
radio
> experiments.

C'mon, Pete - this is a most gratuitious statement. You know exactly how I
feel about radio experiments. And even if telephone forwarding is an
"experiement" as you call it, you've done it, works good, point proven, time
to stop.

>
> > I look for the
> >"substance" - all along I've been talking about building not destroying the

> >amateur network.

This means that telephone forwarding does nothing to solve any of the
problems of support for networking. You decided to telephone forward and
now have decided, to the chagrin of many sysops in this community, to
force it down our throats by transmitting your "experiement" out to the
amateur network. You face unpopularity. I'm trying to get you to see
how telephone forwarding is ruining all we have worked for.

> I gace you several examples of radio network solutions. Things like
spread
> spectrum. I also told you how I have approached radio networking. I didn't
ask
> you to agree or disagree. I told you what I am doing, and things that
interest
> me as points of information.

Fine, as long as they involve ham radio. Telephone forwarding does not
"encapsulate" the traditions of ham radio.

>
> > BTW, I notice I got no answer on how N1KIO and WB0TAX
> >reach your system but I think I know.
>
> I receive traffic from N1KIO and WB0TAX via net/rom, as I told
you.
> Specifically, it is accomplished via an AXIP link. Briefly, these are
AX.25
> encapsulated packets within IP packets. These links are set up in a way that
a
> net/rom can also be set up to cover great distances. As you probably know,
a
> net/rom is good for up to seven (7) links before the connection can go
no
> further.

Aw, please! You're using the telephone, Pete. Why not just admit it?
What kind of fool do you take me for? We've been doing AXIP on the ham
bands for years. Big deal... I'm not impressed.

>
> Your radio link wasn't shut down. Through the W0RLI protocols (as well as
my
> F6FBB protocols), you probably found out that the message was already there.
> You probably got the N - Bid symbology.

Yes, that's it. You, by injecting your telephone forwarded traffic onto
our network, did, in fact, prevent me from receiving traffic and then
relaying the traffic into our local amateur radio network, BECAUSE you had
already done it via the telephone. Thanks loads for doing that - your
"experiementing" crippled my system. (By the way, it's a small point but BID
rejecting is not a W0RLI protocol - it's a global procedure agreed to by all

BBS/Mailbox software authors)

> I am not sure what you mean. I can only guess: Your desire is to have
radio
> take top priority over other forms, because of what you have said below.
> Why the heck did I spend all this time and effort only to have the
> >telephone forwarding nitwits ruin it all.
>
> No comment on your choice of words.

(Remember, please, at this point, you still had not admitted to me that you
had received traffic via a telephone forwarded stream. You veiled it as "I
use net/rom protocol AX.25 encapsulated in IP". I would have had to assume
that you were a telehpone forwarder. Thus I didn't call you a nitwit)

> But let me rewrite this sentence:
>
> Why the heck did I spend all this time and effort only to have
other
> technologies take over a pure radio system that does the job I want it to?

Wrong! "Other technologies" do not do the job "I" want them to. They
undermine what I (and many other hams) want to do.

> >The larger question which we all
> >should worry about is: Why should I now spend any further time and effort
> >only to have the telephone forwarding nitwits continue to ruin it all?
>
> But let me rewrite this sentence:
>
> Why should I now spend any further time and effort only to have
other
> technologies disrupt what I believe works much better?

Uhhh - this sentence has confused logic. Who is the "I" here? Are you
trying to say that I believe this? Do you believe this? Who believes it?
You've apparently re-written my sentence to fit your goals. I guess I'd
much prefer it if you'd leave my sentences be and write your own.

>

>
> 2. The internet network does NOT provide fun for building, or trying out
new
> protocols and wonderful stuff.

No, wrong again. There's only one thought. Building and maintining a radio network is what we're all about which isn't helped at all when someone continues to route around it.

>> >No, we've got to have the speed, baby.
>
> That is a good reason, in my book. Everything going on in
"wireless
> communication", which includes amateur radio, could use high speed.
Actually,
> I don't quite agree with this. Faster throughput is a better definition.

Yup, the phone is faster. Not going to deny it. The fact that it is faster also a poor reason for allowing telehpone forwarded traffic to steal away the fun and enjoyment we all are seeking and have sought since we began linking stations on the HAM BANDS many years back. Amateur networking will continue to decline when put in direct competition with the phone. And, as I read you you keep saying "wireless" at several points here. Could be I've missed the fact that N1KIO and WB0TAX are linking to you by a satellite. True?

> >I'll submit a proposal for you to ponder. I hope you'll agree to try it.
> >Here goes: For one week, let's try not to inject telephone forwarded

didn't
> >engage in the practice of telephone forwarding. I think you'll find that
> >the quantity is practically the same, the quality is probably higher (no
> >more binary squash at least)

"Binary squash" here meant that we have documented many many instances where telephone forwarded messages have been horribly mangled. We talked about N1KIO's problems a couple of weeks ago not to mention the months old Keplerians he was tossing in for good measure. I see the term "squash" has confused things.

> Most every BBS uses "binary squash" except the AA4RE BBS. You use
Xcompression

why
> I have a radio system, and I listed those things I am trying to do.
>
> If you think I am creating a system that will bypass WB1DSW, the answer
is:
> NO.

That's precisely what I think. I asked you to try one week without doing it and see what the impact is. (And I would ask that we do this after I get the UGM link back up. I think that's totally fair...) I find your reasons for not taking the pledge for one week vague and unconvincing. I'm thinking what could he possibly be afraid of.

>
> If you think I am trying to fix a link that has been broken to K1UGM,
the
> answer is: YES.

I will shortly have Jim's 220 TNC for repair (I freely admit it took me a long time to get it from him but it's not my property, it's his). Oh, I get it! This means that if I fix this TNC, you'll stop telephone forwarding? Outstanding!!! Where is my soldering iron...

>
> If you think I am different than you, the answer is: Yes

Remember, it's not just me. You differ from a lot of sysops in this area.

> Right now, the network as you know it suffers from these problems:
>
> 1. Broken Link from DSW to UGM

Taking care of that myself by building and maintaining.... Not by using the telephone. See above.

> 2. Broken link from UGM to RCI

Can't be helped right now due to a personal situation between parties. why don't you call Steve and work on a 220 link to RI instead of "examining net/rom encapsulated long distance tcp/ip protocols" on the telephone. Geesh! I understand he has erected a stacked array and has pointed it north. I can't get to it, can you (on the ham bands)?

> 3. Inefficient link from UGM to Provincetown

Then, let's get someone halfway in between to put up an amateur radio node to relay. Why is no one is interested in that? Probably think that the internet is faster and easier. Still it would be nice to have someone to experiment with in say Foxboro, or Marlboro. You could use the phone here to call somebody up and talk with them about the project.

> 4. No link to NS1N

I've been looking for someone to help re-establish it. I have all the gear necessary except for an antenna and tower space at the target.

> 5. No link to WZ1L

Bill's not interested. I waited and waited and waited for him to put equipment up. I fixed stuff and gave him advice many times. He gave up.

> 6. No link out of KA1TUZ to anywhere except me

So. This is "broken"? Need redundancy? Use amateur radio.

> 7. No link from TR to CHSTR

This is a long standing issue between two stations who really should not be able to link but did. We think it's maybe a receiver problem at TR's site. He's working on it now that we've fixed CHSTR.

This next point is crucial and is the most important point of all I have tried to say these last messages. Notice that none of these problems - NONE OF THEM - is being solved by telephone forwarded traffic nor by "AX.25 encapsulation with IP". In fact, I tell you what -- let's go to each of these hams (K1MEA, K1TR, NS1N, WZ1L, K1UGM, KA1RCI, KA1TUZ) and let's ask them if their ham radio NETWORKING problems are going to be solved by "AX.25 encapsulation with IP packets" (telephone forwarded traffic).

> What is this all mean? beats me, but I am looking at solutions, and I told you
> what I think can work. Obviously, you have a solution, so at least you have

an
> interest.
>
> We need new solutions, Herb.

Again, none of the problems are solved by your "new solutions". I'll admit - the internet is faster. You proved it. The telephone is faster - got more throughput through. Been proving it for many weeks now. Sadly, you made me an unwitting partner in the dissolution of the amateur network - duped me into cooperating with you which should have had my consent. Probably angered a great deal of my downstream forwarding partners (I heard from two of them by the way). In many areas of the country, telephone forwarders and people associated with them have been excised from the amateur network. You really ought to have asked me first (Hmmm...I wonder if you've asked UGM if he minds what you're doing). Alright, so now the experiment is complete, everyone knows it can be done. Internet system works FB. Phone network is the best in the world. Great accomplishment. Congrats. Everyone sees the benefits - nicely done.

But I'm telling you hams now want it stopped.

Thanks for listening.

I just happen to have that number available.
1357 messages, via HF packet links.

N6VV has that beat by a large margin, of course. During the aftermath
of the Loma Prieta quake, he handled over 6000 messages in three days
... on HF packet.

More robust protocols do a good deal better of course.

But that has nothing to do with the issue.
As usual the anti-radio folks attempt to divert discussion of the issue.

As usual, Ed is clueless.
He confuses "broadcast" with "internet broadcast protocols."
You will probably get a better answer via the TAPR APRS SIG.
Check at www.tapr.org
Folks have been doing this for many years. It's easy.

Personaly I feel the most important value is the "purity of signal". I don't recall the correct name of it, but it indicates that your signal is not overmodulated and is clean. PSKSBW 1.09 and I think 1.08 read this number out in the tuning scope any time the signal is idling. The help file explains it. I have seen some signals that decode with numbers that indicate they are sending square waves! They look a bit "rough" on the scope but I would not hav guessed they were that bad by ear or by signal reception.

Rob,

30 messages is an unrealistic expectation. If only 1% of the Amateurs sent only one message a day, that would result in over 500 messages per day. And that's not really enough to support the infrastructure needed . The BBS message passing concept was doomed from day one, just because of how it was designed. It wasn't really designed bad, it just wasn't designed to support the numbers of users that it needed to support.

As to Junk Mail? One person's junk is another's treasure. Comparing to the Internet Spam, what most people don't realize is that Spam is profitable, if it wasn't, why would so many people be doing it?! It's part of any messaging system and you have to design for it and live with it.

I have read what you've been posting, many times. I don't remember hearing
where you've created a solution to move messages across the country at more
than 1200 bps. And no one else has either. The DSY modem is about the
fastest in general use, that's only 56kb.

>
> > Maybe some protocols have been

> "... be competetive." With what? RTTY? PSK31? Morse?
> Explain what radio protocols and networking you are talking about.

Competitive = providing near the same or greater capabilities as others in a
similar business. And since you have a corncob about people including the
word RADIO in their response, I'll play to your game.
With all o fhte microwave frequencies that we have available to us, I don't
know of a single network that is using these to transfer data at modern
speeds. A DS0 at 64kb is trivial for a microwave shot. Something along the
lines of a T1 or even a T3 are easily possible.

But the general user doesn't give a crap if the word radio is used in solving their problem or not. Walk up to a Red Cross shelter where you have Hank on his radio solution, and me on any variety of other solutions and which one will the public want to use?

We couldn't even think at moving this thread to packet radio. The delays would have made what has been a few days stretch into a few weeks. I've got 200ms delays from one coast to the other. Packet would have 200s at it's absolute best, more like 200m or even 2,000m.

Never mind Ed.

Just can't get over your "digital modes of ham radio must be JUST
like the internet or they are useless" fixation.

Just go away, this newsgroup is for hams who want to do things
over radio links. It is not for you, since you don't want to do that.

What *are* you guys talking about?

500 - 1000 messages per day was the norm, when the network
was working. Was a rare month I didn't handle 20,000 messages..

Posted those stats by year to this group some time ago.
The drop-off occured *after* the Land Line Lids began to bypass
the radio network, and continued to the present, as the radio network
was little by little taken off air.

Wrongo Big Time!
You might not have had access, but there was definitely a lot of Internet access available during and after the quake. You see, the Internet was originally designed as a fault tolerant network designed to live through the worse disasters. As such, there are many core Internet circuits that are extremely fault tolerant. It's very common for many locations to be served by multiple faul-tolerant circuits from multiple central offices. This doesn't include the satellite connections that many organizations have.

What about all of the Amateur facilities that went off-line? My review of the disaster showed a lot of repeaters going off the air, as well as VHF/UHF digipeaters. It seems as if very few of the Amateur Radio installations were earthquake hardened, unlike a large number of Internet facilities.

radio.

Yes, you are right, you don't have any customers because you aren't
providing a needed service.
Customers don't mean that they have to pay with money. Customers are the
users of your service. In Amateur Radio, we have many customers. Repeater
owners have the repeater users as customers. Clubs have members as
customers. Digitial networks have those who send and receive messages as
customers.
Those Amateurs who work Emergency Services have the world as their
customers.

He's right, Amateur Radio cannot compete with the Internet. So let's follow the situation. BBSs sprung up on the telephone network. Ham's copied the concept for packet radio. BBSs on telephones migrated to the Internet due to it's significant advantages. BBSs on packet radio mostly migrated to the Internet due to it's significant advantages.

Do you see a slight problem here Hank? You are asking us to believe in a concept that you are calling "landline lids" from which the whole BBS concept was stolen. The way that the BBS system was put together never worked well, it will never work well. If you want 1200 bps data to work, you are going to have to find another "killer app" aside from a BBS. Packet, passing messages around just can't compete with the Internet. But there are many things that packet can do that are competitive. One of the easiest modifications to the existing network is just what you are complaining about, replacing slow long-haul circuits with the Internet. And then using the faster VHF/UHF connections for dissemination of information to end users. In the event of a disaster, you should be able to provide routing via a VHF/UHF link until you get to a station that has connectivity to the Internet. That's the best of both worlds. It's not the Internet taking over. The Internet has some significant advantages, instead of fighting it, why not use it.
Although I hate to mention it, it's a lot like CW, a few die-hards wanting to use it, but no longer a significant factor.

3817. Re: internet repeater linking

First rule is disaster planning, never rely on anything. You should always have a fallback solution. There are just as many problems that can knock a wireless system out of operation as can knock a T1 out of operation.

You point about "you only have to reach the national network" is right on the money. After designing and implementing a transcontinental network for another service, it's not worth the effort. In every disaster that I can think of, all you need is to provide communications for about 200 miles before you reach reliable services. And in many cases, all you need is about 50 miles. So, far disaster recovery, we don't need to be looking at transcontinental links, we need to be looking a short-haul with interconnect into other networks.

If a packet station can provide RF links to stations in each of the 4 cardinal points, at distances of 50 miles, as well as an interconnect to higher-capacity networks, then the station should be significantly more disaster resistant. Redundancy is what creates reliability in disasters. You'd have to naive to rely solely on HF to transfer traffic, a good solar flare could bring forwarding to a halt.

Amateur Radio Operators used to be looked at as being the "innovators" Sadly this distinction has now passed us by. Let's let CW go and let's create something else that we can rally around!

Message-ID: <eQYVGXmHAHA.345@cpmsnbbsa09>
Source record: 11011

Hank,

Folks who know me know that about as far from the truth as their is. I've been doing networks for years, both professionally and personally. I created the design for the packet network used in CAP. I really don't care "how" things are done, I just want to solve problems. In CAP we had a fairly nice transcontinental network setup. We were moving a fair number of messages and getting the rank and files interested in the solution. But then the big guys stepped in. In short, they outlawed our equivalent of @ww messages. This dropped traffic on the network significantly. And with this drop, user's interest dropped also, there just wasn't enough information to warrant the expenditure to get on the air.

Hank, you were one of the instigators in this phase of Amateur Radio, and you efforts were widely appreciated. You led many Amateur Operators away from a CW or Voice only attitude to a Digital way of life. I find it sad that someone that I have looked up to over the years has an attitude such as yours. I was expecting a forward looking individual, not one set in his ways such as yours.

Your arguments were exactly the same ones that many used to defend the voice and CW traffic nets. "How can a CW net survive if packet gets the message there first?" It's really ironic to hear you using the same arguments. I'm a technology guy. Amateur Radio used to mean technology, sadly no longer does it. But I think that there are some areas in which we can regain that title. Connecting repeaters together with digital audio over any type of link is an exciting opportunity. It indeed would be much better if we had 64k+ radio links, but we don't, so we have to settle for the next best thing, the Internet.

People aren't here to make your life miserable. They aren't forwarding traffic across the Internet just to put you out of business. They do it to experiment and provide a better level of service. Who likes reading ARRL bulletins that are three days old?

What I'm upset is that you see the word Internet and you go jumping all over it. Let others do their thing. Where would packet be today if it wasn't allowed to do its thing? Remember how many people didn't want to set aside ANY spectrum for packet radio? Remember how much of a fight it was to get 145.01, and then the other frequencies allocated to packet radio?

And while I don't talk about packet with the authority that that RLI brings, I do have a little background to speak from. I've create some packet software that's still used today. I've got a half dozen VHF packet stations in cases for rapid deployment. I've spent a few years doing transcontinental forwarding.

Oh, and by the way, this group is rec.radio.amateur.digital.misc not rec.radio.amateur.digital.packet. This group is for folks who want to do OTHER things with radio. Packet Radio isn't the ONLY digital mode.

Hank, I wish that you could come out of your current attitude and put your creative talents to work again.

Ed

Didn't think anyone would notice the "yet"!

Several of the APRS nodes I can hear are near St. Helens
and Adams (the adjacent volcano).

I noticed the "yet". I interpreted it as generic sarcasm, shame on me!
You can be subtle when you really want to :-)

Whoa there pardner. This group is rec.radio.amateur.digital.misc because,
way back when the rec.radio.amateur.* hierarchy was reorganized. A family
of rec.radio.amateur.digital.* newgroups were proposed - and only this one
survived the vote. It really wasn't meant to end up this way.

I'd be a little cautious about newsgroup-charter-mongering :-)

Heh heh ... quite a lot of what (many/most) folks take for sarcasm is
either my Midwest dry humor, or something subtle just to see if anyone
is paying attention ... or at least an attempt at same ;-)

Some folks think I take this stuff seriously!

We would be more concerned if Mt. Hood blew, since it is a bit closer
than St. Helens and Adams. Adams about 75 miles (nice view of it
out the shack window), Hood about 55 (also nice view), St. Helens
about 65 (behind the ridge to our north).

Perhaps GPS at each of the nodes near volcanos (or faults) would
provide useful data to the folks who monitor such things. Don't know
of anyone doing this. Suspect USGS might even fund something.

At one time I had a receiver on VLF hooked to a chart recorder.
Monitored one or another of those "big signals" at 10.2 KHz, 13.7 KHz,

etc. Nice sunrise/sunset effect, but the main use was to get early
warning of incoming ionospheric shocks, which might trigger some
unusual auroral propagation. Was doing a lot of DXing on 2M at the time.
Might be useful to have some systems like this toss alerts into APRS,
or perhaps better into the DX Cluster network.

(To the Land Line Lids: yes, I *know* the internet is faster)

come on hank, I know you are capable of better reasoning than that
(this is meant as a complement).

at the end of the day, any channel beats no channel hands down. The message
that keeps getting lost is that amateur radio needs to do better and
it can do better. Yes, radio will never beat fiber but that doesn't
mean that we shouldn't try to give copper a run for its money.

the Internet, like it or not, sets the lower bar. Ham radio should be
able to do as good as $100 modem for not more than twice the price.
Hams should be able to cooperate and get the message to where it needs
to go by any route possible. If that means tunneling through the
Internet because there aren't enough hams on the ground, then so be
it.

life is too short for pissing contests.

Charles,

While your idea is indeed a step above basic forwarding, it has some implementation problems, especially on HF.

Just to make things clear, I believe that your use of the term multi-cast is a little different than the generic use of the term. It seems as if your use of technology is actually a broadcast. The difference is that a broadcast is to all stations, while multicast is actually multiple routing hubs directly sending information to individual stations. But semantics aside....

The biggest problem with your multicast solution, especially on HF is that it does not include error correction. It is very common to have to retransmit packets on HF multiple times due to static or fades. Without an adequate error correction method, the chances of all receiving stations receiving a packet is very low. Multiply this by the number of packets in a message, then the probability that messages are transferred are nil.
To implement error correction in your solution, a protocol by which each receiving station would ask for retries would be required. Even with an error correcting protocol, traffic would come to a halt if one of the receiving stations was marginal, asking for resends on most or all packets.
The nature of HF makes any multipoint solution a big problem. With the network path to all stations being very variable, the reliability is just not there. Think of it this way, what is the probability that three stations can receive a signal from a fourth, for three seconds without at least one of the receiving stations missing a bit? Sure you can add FEC, but that increases the transmission times and still doesn't help the overall problem.

There's also a problem on VHF/UHF, the classic hidden transmitter problem. While no where as significant as the hf static and fades, it still becomes a problem. When a broadcast station starts sending its messages, there is nothing that prevents other stations from transmitting. And since a broadcast packet would go out as a UI frame, there is no retransmission. And as in HF, there is no error correction to cause the packet to be retransmitted.

In either case you have to be careful about network congestion and multiple stations wanting to transmit at the once. This could be greatly reduced by scheduling different stations with transmit periods.

The broadcast/multicast solution that you have suggested works fairly well on networks where the communication paths between stations is very strong, like an Ethernet. But it has problems with networks with high BER.

No, I'm not shooting my mouth off.

>enough PSK operators adopt this type of report it will quickly become
>standard practice.
>73......Gerry ZL1AWW

The problem with the QRK reporting system is that it doesn't indicate
why the signals are bad or excellent. So the operator isn't given any
indication of what steps need to be taken to improve the link. Basically,
it is just the 'R' of the RST system.

Adding the S and T information is an improvement over the QRK report
because it gives the operator potentially valuable information on the
quantity and quality of the signal. That's why RST was instituted. What
we need to do is to refine the S and T reports to make them meaningful
for PSK31 signals.

The first thing we need to do is divorce the notion of S meter readings
from the 'S' report. Historically there is no parallel between them. The
S report merely uses an arbitrary scale that goes from very weak (1)
to very strong (9). There is no direct correlation with an S meter, which
often did not even exist on receivers in the era in which RST was
developed.

S meters on current amateur equipment generally do not follow the
somewhat mythic 6 dB per S unit anyway. They are in practice very
nonlinear from one S unit to another, and typically range from 2 dB
to 5 dB per S unit over their range. So the use of S units for reports
is very misleading. (This nonlinearity is intentional to a large extent,
manufacturers have found that amateurs tend to prefer receivers
with a "lively" S meter.)

For the purposes of PSK31 (and other sorts of signals too), the more
interesting S value is the signal to noise ratio. That information is usually
conveyed by color on the waterfall display, but it should be trivial for the
software writers to give us a number for the selected signal in the same
fashion as they now give us an IMD number.

The 'T' report is signal quality, and that's very important for PSK31. We already have a good measure of it. It is the IMD number reported by the software.

We shouldn't limit ourselves to single digits for each of 'R', 'S', and 'T'. That may have been adequate in CW days where "by ear" estimates were the rule, but our software can do better than that. I'd suggest that the 'R' number should report percent correct copy to the nearest 10 percent, IE 00 to 10. SNR should be in dB, a 2 digit range should be sufficient. T should be the IMD value, also a 2 digit value.

So a PSK31 RST might be 09 15 23 meaning 90% correct copy, a SNR of 15 dB, and an IMD of -23 dB (minus assumed in the reports). This gives the sending station real information. He can tell whether he needs to increase (or decrease) power, and whether he needs to work on the linearity of his system to improve signal purity. The software could offer a "hot key" to insert this information automatically where a signal report is required.

Right back where we started from :-) I though the idea of PSK31 was to provide a friendly keyboard mode that didn't have the latency of error correction and ARQ. Somehow we seem to want to change it so it's just like Pactor and Clover - but then it won't be a friendly keyboard mode any longer.

I do think Gary's reporting system makes sense.

>capable of handling the amount of traffic that was needed of it.

Of course it can be questioned if high traffic capacity is needed.
Usenet shows that no matter how far you increase capacity, people will
always use it up. The average quality of the messages will just decrease,
and their average size will increase.

In the early days, both on terrestrial packet radio and on pacsats, one
would come home and eagerly connect to see what interesting bulletins
there were. Maybe 30 of them on a good day.

Over time, their number increased but the fun reading them decreased.
Kill filters were required and built. But it became increasingly difficult
to receive content interesting enough to warrant the effort to weed it out
of the junkpile.

And so, a year or two, I (and many, many others) just quit connecting to
the BBS. My personal messages are forwarded to my station, and the
bulletins I just skip.

Of course there will always be enough users to send junk around, but the
good days of discussions and useful information are gone. You won't fix
that by increasing capacity. That will just make it worse.

Wrong. The protocols were designed, implemented and tested and have
been in use for over a decade now. On packet satellites.
The hidden transmitter problem is worse there, transmitters don't hear
eachother at all. Errors may be fewer than on HF, but poor stations that
miss many packets are present just as well. The re-transmissions just help
the others on the channel. When you know you have a good station, you just
wait sending the last few hole-fills until other stations seem to have
lost interest in a message and retransmits are not coming by themselves.
The transmitter station also queues and merges hole-fill requests so that
multiple fills do not result in quick retransmissions of the same packet.

So what you need is a lower rate than that. Not because the network would
not be able to transport it, but because the readers would not be able
to digest it.

A better message category structuring system might have helped (putting
everything in a single list with 6-character destination names sucked from
the day it was invented), but Usenet shows that some people just won't get
the intended purpose of the structure, and crosspost or multipost.

The mailbox software developed and used in Germany uses a groups system,
and indeed both multiposting and posting of links to articles in other
groups is commonplace there, causing more grief for the other countries
where this "Diebox" software and its successors isn't in use.

>As to Junk Mail? One person's junk is another's treasure. Comparing to the
>Internet Spam, what most people don't realize is that Spam is profitable, if
>it wasn't, why would so many people be doing it?! It's part of any messaging
>system and you have to design for it and live with it.

For a simple bulletin system like the packet BBS to function, there should
be a mentality that makes everyone ask "is this really worthwile to send on
the bbs system" before sending a bulletin, especially to a wide
distribution area. It was like that in the first decade of Usenet. The
software printed a screen of text at every post, stating that the message
one was going to type was to be sent all over the world to thousands of
computer systems and that this was going to cost effort and money.

When everyone with a transceiver for sale or a cry for help would first
think about the implications of sending this @WW and about the usefullness
of a response from the other side of the world, the amount of junk would
decrease.
But there are always people posting without thinking first, so any message
network remains filled with mostly crap.

Source record: 11026

I found that a day's worth of packet bulletins took about an hour to "multicast". This left 23 hours to kill... So they were re-sent at different times of the day. That's 23 retransmissions of each bulletin per day.

It's been a while since I did that test run, but if I remember correctly, the transmitter would be keyed-up for several minutes (7-8 I think, but may be wrong) then it would stop transmitting for one second, then back to the grindstone again for 7 more minutes. Compare this to a normal 1.2 kb packet transmission with a PACLEN of 80 or 128, then you start to get an idea of how much "overhead" is eliminated. This is why it sends bulletins that might have taken you several hours to recieve in about an hour.

There's no "problem" sending updates... As a matter of fact, that's what you spend the great majority of your time doing!

Transmit on several bands at once, and recipients should be able to find a clear signal at just about any time of day.

When I decided to do that test run, I talked to the guys at the ARRL and FCC. Everybody told me to go right ahead; Nobody told me that there were any legal issues to worry about. I had made it clear that I would be sending @WW bulletins only. I heard nothing but encouragement.

W1AW broadcasts information "of interest to Hams" every day.

Who is intertested in developing HF multicast? I am!

I'm also interested in VHF/UHF multicast, for that matter. It looks like it might be fun.

Does anyone have any idea where I would be able to get my HAM radio TCP/IP address from.
Thanks

You want to get in touch with the "regional coordinator" for your
area. Where are you located?

However, it seems to me that you may be putting the cart before the
horse a little bit. What I recommend is that you get your station "on
the air", and get in contact with hams that are active on packet on the
band you want to use. They will be able to help you more than us here.

I'm curious, what band do you plan on using, and for what applications
will you use TCP/IP?

The problem with TCP/IP is that it has basically died on Amateur Packet
radio. The fact that there are restrictions on commercial content(the
level of restrictions is debatable), puts a big damper on trying to
hook into the Internet from portable devices - probably the most
desirable aspect of running TCP/IP thru radios. There is a new service
called MURS(Multi-Use Radio Service) that has just been approved by the
FCC. It does not require a license to operate, digital transmissions
ARE allowed, and they are not restricted to non-commercial
applications. If you haven't bought a radio yet - I would consider
looking into this.

Yeah, this is an interesting idea. The name 'multicast' is a little confusing
compared to the use of the word in ip. In those terms it's more
like 'broadcast.'

If you're just sending, maybe you could use PSK31. Just
make a program that makes a file with the last day's @WW messages, put
a CRC check on each one, and then update it every hour. On the
transmitter just send it over and over again on PSK31. On the receive
end, you download the stream. Check the CRC's and the one that pass
you send over to mail.in on FBB.

Yes, I'm aware of those protocols.
I understood the topic to be HF protocols, my mistake.

This is true in some areas, not in others.
In some areas tcp/ip is alive and well..
If you are already on packet, you might check with wb1dsw or ka1rci.
They should be able to point you to the local coordinator, and
provide a good deal of information on how the network is structured.

> The fact that there are restrictions on commercial content(the

Suddenly we have "using the tcp/ip protocol" mutated into
"connecting to the internet" and this is a problem because of
"commercial content". Huh?

As I recall from the earlier discussions, there didn't seem to be
much interest. If a few stations would sign up for testing and
deployment, it might be fun to do the protocol over CLOVER FEC.
That protocol would seem to be a natural.

> I'm also interested in VHF/UHF multicast, for that matter. It looks like it
> might be fun.

Where is the spec for the multicast protocol used on the pacsats?
Looked at it a long time ago, and remember that nobody seemed
interested in adapting it to other uses.

I never see any traffic actually arrive via the pacsat links, except for an
occasional personal message. Do they handle bulletins anymore?

Oh, I wouldn't say that. I got started in IP on 145.01 back in 1989
with a program called NET. We had it running into some KPC-4
dual TNC for UHF/VHF operation. It was kind of neat to send the
packet on UHF and get the ACK on VHF...

Then NOS came out and it was pretty neat. When I and a buddy
bought a Gracilis packeTwin system and a Tekk radio, we had a
16 mile link with some beams on them. We first started out with
the NetRom stuff, and then started playing with the UDP packets
and segmentation. We found that setting in a 1500 byte packet
and sending out 512 byte packets really moved the data. Basically
the IP overhead was in the first 512 bytes, and the rest were pure
data. This setup was actually faster than our 19.2k modems we
used to do UUCP from Unix boxes (AT&T 3B2 -- Yee-Haw!
a wonderful box) via the Telco.

Most of the people around here were never that interested in the
NOS operation after a few days. These guys all needed a GUI or
colored text to get them through the day :-)

I did come up with a pretty neat application. The National Weather
Service had a NOS system and you could FTP weather data from
all the remote sensors all over the state. I just scooped this every
hour and then sucked it into Excel every month to make some
graphical charts. Pretty neat to analyze your illness against
barometric pressure, or lawn height versus rain :-)

Take a look at: ftp://ftp.ucsd.edu/hamradio/misc/auto-ftp.zip
For some old history :-)

I think you just hit on the REAL reason Amateur packet TCP/IP has gone
dormant - the lack of applications.

If it wasn't for APRS, all Amateur packet radio would be as kaput as
FidoNet.

There now ARE applications for packet radio AND TCP/IP. You watch, we
are poised for a ressurgance of activity - all it will take is coming
out with inexpensive modems(TNCs are history), and a little bit of
software. I'm working on the solutions right now. Packet didn't die -
it just went into hibernation.

Not exactly. It is just that MURS is better suited than the ARS for
rebuilding the packet radio network - for two big reasons:

1) The 2w ERP limit is huge advantage when attempting to construct an
Internet-backboned "cellular, frequency re-use" system: Blow-hards
like yourself can't set up 500w ERP hilltop stations and "blow away"
everyone in your county, AND all the surrounding counties to boot!
Besides, with the Internet as a backbone, you don't NEED high-power,
high-level nodes.

2) Like it or not, people WANT commercial content. I don't see what
you are complaining about now; first you were bitching about hams using
the Internet as a backbone, because of all that "commercial" content.
Now the FCC has provided us with a solution, you are bitching about
that.

Face the facts, Hank - the world has changed.

Hi Brian,

The latest version of PcPakRatt is 2.1 and that release is Y2K compatiable.
However it is only 16 bit. We have PkTerm '99 which is the only 32 bit
PK-232 software available that runs it in host mode.

You can download a demo copy, and play with the packet and RTTY modes at
http://www.cssincorp.com/pkterm

FTY, CSS owns both PakRatt and Pkterm.

Uh, pardon me. You've found a new hammer and now everything is a nail?

MURS is not really anything new. It is recognizing that use of the itinerant
IB VHF channels was out of control.

MURS radios need to Part 90 type-accepted. Strictly speaking, this means
you can't just build or hack a radio for this service.

Further, MURS is six little skinny, regulated channels. It's no replacement for
oodles of thinly-regulated spectrum available to a radio amateur. MURS is a turn-key
consumer band with tight restrictions, and amateur radio is an experimentor's band
with little practical regulation.

Anyway, you're apparently not aware of the better Part 15 services, such as 900MHz
and 2.4GHz. In some cases, these allocations even overlap with amateur bands. I don't
see a flood of turnkey amateur operation there.

> 1) The 2w ERP limit is huge advantage when attempting to construct an

What does this have to do with MURS in particular? Nothing at all. You might
be surprised to find out how many modified VHF amateur radios are being used on
the VHF and UHF business bands - without power limits.

> 2) Like it or not, people WANT commercial content. I don't see what
> you are complaining about now; first you were bitching about hams using

The FCC has long permitted commercial data, in the Part 90 service (for example).
Just fill out a license and buy type-accepted gear. It hasn't set the world on

fire. MURS will not, either. It is not a substitute for amateur radio.

> Face the facts, Hank - the world has changed.

Hank might have some zany ideas, all that Pacific Northwest moisture seems to have gone to his head sometimes :-), but I believe he's right on about this topic.

Stewart, you're excited about MURS. Have you ever listened to those frequencies? I don't think you'll be as excited after all the voice users start jamming your data network.

This topic was done to death about 5-6 years ago. Several robust
"request fill" protocols were proposed, none were tested. The regulatory
issues are minor with multi-cast, serious with broadcast (in the US).

A bunch of us code writers might well add such protocols, were there any
interest. 5-6 years ago there was no interest in actually *doing* something.

CLOVER supports the underlying concepts particularly well, PACTOR
has support for them. They could be used with PSK31. They could be used,
in fact, with just about any signaling protocol. In the long distant past (when
I had a model 104 TTY on air) something similar to this was done for
distribution of some CP/M code (Lynn, WB6UUT, I think?)

What is needed are hams interested in actually *doing* it, instead of
talking about it. Anyone home out there?

Yup, this is what CLOVER does (reports SNR).

> The 'T' report is signal quality, and that's very important for PSK31. We
> already have a good measure of it. It is the IMD number reported by the

CLOVER reports phase dispersion as well.

> We shouldn't limit ourselves to single digits for each of 'R', 'S', and 'T'.

CLOVER reports information about sub-block reception.

> So a PSK31 RST might be 09 15 23 meaning 90% correct copy, a SNR
> of 15 dB, and an IMD of -23 dB (minus assumed in the reports). This

Then we add some FEC ... and ARQ ... and ... there we are!
I think this is actually a *really* good idea.

With the protocol in open source, folks can play with it and improve it.

Of course this would be a lot different than PSK31 ("Just like RTTY, except
it sounds a little different.")

Wouldn't be the same protocol.

What I was hinting at was that it might be fun to experiment
with various different protocols of intermediate "flavor" between
PSK31 / RTTY and PACTOR / CLOVER.

CLOVER has some of that idea with it's FEC mode.
One could use that mode much like one uses PSK31, and get
a bit of error correction as well.

Will there be inforcement of that limit, then?

We have many licensing systems with a power limit here, including
MARC (CB), LPD (lowpower on 70cm), Amateur radio. The most interesting
activity for many users seems to be to output more power than allowed and
not being caught doing it.

(not difficult, because the administration is not very interested in
enforcing the limits. the only exception being Amateur radio, where
license limits are only enforced opon those that the radio society's
big bosses don't like. when they call the authorities, immediate action
usually follows)

3856. WTB: Windows software for an SCS PTC-IIe TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-16 00:00:00 UTC
From: Carlos Portela <cportela@simple-sw.com>
Message-ID: <8pvig3$1a7k$1@news.gate.net>
Source record: 10952

Hi All,

I just bought this unit and installed the software that came with it. The included software (PlusTerm) doesn't seem to be great but it probably works for most people. However, in my case, I need to run the software from an IBM ThinkPad 600X which sets the COM port to 5 and PlusTerm says that this is an invalid port.

There must be a good Windows program out there (FREE or reasonably priced) to control this great box. From what I hear this is a very good MPC that is not well represented by the software bundled with it.

Thank you in advance!

Carlos

Just a quick note guys to say that there is a new release of Mako sans software for RTTY. It has supporting help files in English which have been compiled by the help group headed by Jan KX2A.

The software is fantastic, and if you have never tried it give it a whirl.

The file on my download page is for pentium use.

http://www.g3vfp.co.uk

Hope you enjoy it.

So CLOVER FEC would work ok for that use.

The issue is how to find the 10-15 stations interested in setting up and
network and playing with the protocols. For the original packet network,
it took me more than 9 months, and many hundreds of phone calls and
letters to get things going. Once the first 5 or 6 were signed up, and the
protocol was finalized, it got a bit easier since they helped recruit more
stations :-) I'm not interested in doing that again ...

But my comment was about today! (Keep this in mind ...)

> "NOS" was just the name of a certain version of "NET" that had a modified
> internal structure so that the interface between "applications" and
> "kernel" more resembled the BSD socket interface, but it was never
> separated into a kernel and applications at the distribution (executable)
> level. All the applications had to be compiled and linked with the kernel.

That is true if one assumes the applications and NET (or NOS) were
running on the same machine. I always ran NET and NOS on it's own
machine, thus providing access to the ham radio network to other
machines running the same, or some other, OS. Then you have any
and all networked applications able to run native, and run over ham
radio via the NET (NOS) "gateway to Ham Radio" machine.

This also has useful firewall implications.

> The result was a very large number of different "NOS" versions, each
> extended in some direction to include applications the particular
> maintainer liked, and with a stability reflecting the programming quality

> of that particular maintainer. You know, being sloppy with memory
> allocation or pointer handling just made the program leak memory or crash
> for other reasons, killing your entire station.

This was the failure of the tcp/ip coders. They somehow missed, or did not
consider, the obvious solution: partition the problem onto more than one
machine
Cost is not an issue since NET (NOS) can run on any old junker when it
does not have to bind all the "applications" into itself.

> It took until 1992 for freely available Unix-like systems to come on the
> market (I installed my first Linux system in december 1992), and THAT was
> something that would have been nice to have in the early NET/NOS days.
> (the first NET version was released in 1985)

It was available in late 1984 if you lived near Phil ...

> Now you could independently develop and run applications in separate
> processes, and have them crash independently. Plus existing applications
> could be used with packet radio without having to adapt them into the NOS
> environment. This was a big win, but it was too late.

And the model was still really tasks inside one process. The support for
running under DV never did seem to work right, OS/2 never caught on,
and doing things in Win 3.1 didn't seem to work right either.

> Most die-hard NOS users would not part with their system, learn Unix/Linux,
> buy a better (at least 386) system to run it on, etc.

Junker 286 became "free" or "nearly free" by the 1990 time frame.
I was giving them away as we junked 'em out at work then.
In any case, NET (NOS) could be run on XTs, which were very
available for free or near free a year or two earlier.

> (I am not counting the happy few that had an old 3B2 from work, to have a

> The really attractive applications only got widespread with the
> introduction of Internet in the general consumer market (around 1997, 1998)
> and by then the amateur packet network was already losing its most active
> proponents.

Approx 1992 is closer to the key year. Initial version of Mosaic was
available then, many email clients were available, newsreaders had
become robust. Even earlier all this could be done using WFW 3.11.

But see further comments below: if one used email and netnews,
one was divorced from the existing BBS network.

Development stayed stuck in the "monolithic single process" model,
and had not yet begun to move toward network computing. Maybe if
a few folks from Sun had been involved in the Ham Radio work things
would have turned out differently.

> So, it is not fair to say there was never a lack of applications and than
> anything that runs over TCP/IP works. It does now, but it did'nt back
> then!

Well ... it *did* but the folks involved with *NOS (JNOS, WNOS,
WAMPUS, et al) seemed stuck in the "monolithic single image" mode.

There was a lack of consideration of other system architectures, which
continues to this day. SNOS exists simply to demonstrate that it is
easy to solve the problem: it doesn't have any "applications" bound
in to it's code, it just does the networking and protocol translations.
Protocol translations: nntp <-> bulletins, smtp/pop3 <-> personal messages.

At the time that the NET -> NOS transitions took place, I was pretty much
out of the loop, being very busy doing a startup and then moving from
CA to OR. Wasn't paying much attention to ham radio again until
after Johan moved to Japan and the JNOS project was over.

I do the same here, plus one additional thing: I'm sending this across
a ham radio link, from one Windows 98SE system to another,
and thence onto the internet. It can work both ways: ham radio
data over the internet, an internet connection routed over ham
radio. Both are easy.

That's the problem with using CLOVER for this purpose... There are few owners of CLOVER equipment who would be interested in going into "receive only" mode for an extended period of time. If somebody came up with a soundcard compatible CLOVER monitoring program (especially if it worked in DOS) then you would have a much easier time getting volunteers.

Cathryn's suggestion of using PSK31 sounds much more likely to succeed, for that reason. There are already hundreds of PSK31 stations out there, and nobody had to invest big bucks to get any of them up and running. With a much larger user base to work with, your chances of assembling a decent startup group rise proportionately.

Multicast's efficiency is directly related to the number of receiving stations per transmitter. Anything that drives up the number of receiving stations also drives up multicast's efficiency and utility.

Stick with @WW bulletins. If you start adding lots of nonessential "goodies", you are throwing away valuable update time and reducing your ability to move the @WW traffic. Once it's established that you are moving @WW really well, that would be the time to consider adding or not adding additional content. Remember that a LandLine Lids' favorite way to undermine legitimate digital efforts by Hams is to insist upon jacking up the content level until the system is hopelessly overloaded. - THAT's why the @WW "problem" got out of hand in the first place! - So stick with @WW only, despite inevitable pressure from various LandLine Lid types to do otherwise.

There is a lot more code to write to use PSK31. For CLOVER almost
all the needed code exists, and at least one author has indicated an interest.

> Multicast's efficiency is directly related to the number of receiving

Using CLOVER FEC, there should not be much problem handling
everything that is available to handle. I'm doing it now in ARQ mode,
to 5 different stations. Some of them might be interested.

I see Steve is up to his usual level of useful commentary.
You have any interest in Ham Radio Steve?

Want to take part in some HF multicast experiments?

Would CLOVER or PACTOR (or AMTOR for that matter)
FEC be a good way to go?

Yes. But WW BBS has no merit, technically or socially.
So if that is the end product, you have cheated the public in their
allocations to us.

> Want to take part in some HF multicast experiments?
>
> Would CLOVER or PACTOR (or AMTOR for that matter)
> FEC be a good way to go?

I agree with Cathryn that PSK31 is the proper way to go. The
software and hardware are endemic to the digital part of the hobby.

Not only that, but a fine Windows DLL is available to use for the
low level part: http://www.qsl.net/ae4jy/pskcoredll.htm by AE4JY.

One thing to keep in mind, is that most computers can decode
multiple PSK31 signals with CPU to spare. Thus, you could use
diversity reception/transmission, rather than FEC.

Now comes the hard part. Everyone want to have their callsign in
the header, so who gets elected transmit operators? If Elmer gets
pissed off, he will start his own group just to see his callsign in
every message.

I think there should be a dramatic change in the mail header. The
mail header does NOT need to show the path. A mail header that
is longer than the mail message is unproductive.

What may occur, is that a station in Seattle may transmit all day,
and a station in Phoenix picks this up. It send this via VHF/UHF
to a buddy across town who transmits all day and night, which
is picked up by a station in Montana who hears both of the
stations all day, who sends this to a buddy across town... etc, etc.

Let us propose to kill any header ideas of the past, and rethink
that issue. This is not a network that can be traversed forward
and backward. The path means nothing. What kind of mail header
should there be?

Off the top of my head, I would think a generic part of the standard
email header would be enough. Adopting the state.ham.us or
province.ham.ck would add some sort of routing by country
capability. I don't think ampr.org is a viable tool any longer.

There you go, bark! at that Chuckles...

I disagree on the protocol. UDP only supports one data packet in each
direction (as in a query and response) before closing the connection. TCP is
what is needed as it can send a session (or a group of packets bidirectionally)
before closing.

I am deeply disappointed to warn you not to deal with Warren Brooks W4WWB. He advertised a radio on ebay that was complete, but needed some work. What arrived was a parts radio - Pieces were missing and it will not power up. After he ignored my emails I contacted him by phone and in his best good ole boy drawl he told me " you bought it, you own it". He would not allow me to return it for a refund. I know that ebay is a take your own risk venture - but deliberately lying about the condition of the radio to sell it is dishonest. What a disgrace to the ham community. Don't be suckered by this man like I was.

I believe you're mistaken. UDP is an unreliable datagram service that makes
use of IP fragmentation and reassembly. You can open a UDP socket (there's
no connection to speak of, just an end-point for the demultiplexing) and send
as many frames as you'd like.

It's not transaction based like you describe, at least not at the protocol
level. There may be implementations of UDP APIs that are broken, of course.

In simple terms, TCP is a connection oriented protocol that is reliable. You
would
want to use this for reliable things like a database connection, Telnet, etc.

UDP is a connectionless oriented protocol for things like audio and video.
It doesn't do much more than provide ports and checksum to the IP protocol.
TFTP (Trivial File Transfer Protocol) and NFS (Network File System) were two
early protocols that rode on UDP. Not because the were unreliable, but because
they were used on an Ethernet LAN where data loss was statistically low.
Have you ever done NFS across the Internet? Bad, I know. Recent
implementations (Ver 3) allow you to specify TCP for NFS.

Typical LandLine Lid "thinking"... "Hey, let's use the Ham digital network
to send stuff you can get easier and faster on the Internet!"

How clever.

The "BBS crap" you disparage is the messages and bulletins that thousands of
HAMS care to exchange with each other. It doesn't come from the Internet; It
comes from your fellow Hams.

No wonder you (as a LandLine Lid) have so much trouble accepting it. ;-)

The spec is in the proceedings of the 9th CNC (1990), but there have been
later mods and extensions that were distributed via the satellites as
files. Hopefully they can now be found on the web somewhere. If not,
ask Jeff Ward, K8KA.

There have been at least two implementations of a broadcasting station (I
have experimented with one from Japan), and one broadcasting the content of
an F6FBB BBS "on-the-ground". I don't know if these went beyond the stage
of experiments.
The current German BBS program from the Baycom group should also support
it.

>Ya gotta be kidding!
>Anything that runs over tcp/ip works!

Not in those days, Hank!
"NOS" was just the name of a certain version of "NET" that had a modified
internal structure so that the interface between "applications" and
"kernel" more resembled the BSD socket interface, but it was never
separated into a kernel and applications at the distribution (executable)
level. All the applications had to be compiled and linked with the kernel.

The result was a very large number of different "NOS" versions, each
extended in some direction to include applications the particular
maintainer liked, and with a stability reflecting the programming quality
of that particular maintainer. You know, being sloppy with memory
allocation or pointer handling just made the program leak memory or crash
for other reasons, killing your entire station.

It took until 1992 for freely available Unix-like systems to come on the
market (I installed my first Linux system in december 1992), and THAT was
something that would have been nice to have in the early NET/NOS days.
(the first NET version was released in 1985)

Now you could independently develop and run applications in separate
processes, and have them crash independently. Plus existing applications
could be used with packet radio without having to adapt them into the NOS
environment. This was a big win, but it was too late.
Most die-hard NOS users would not part with their system, learn Unix/Linux,
buy a better (at least 386) system to run it on, etc.

(I am not counting the happy few that had an old 3B2 from work, to have a decent user population one needs to use hardware that anyone can get)

Of course it became worse when Windows 95 finally appeared and all the hams went using that OS, for which usable interfaces between IP and packet radio did not appear for several years. The only "solution" was a separate box connected to a shack ethernet and running some router software (NOS, for example). This was just a too complicated solution when one could also run a packet terminal program interfacing with a TNC directly connected to the Windows box. The BBS user did not see any advantage of a network protocol anyway, as his connection is point-to-point over a local link.

The really attractive applications only got widespread with the introduction of Internet in the general consumer market (around 1997, 1998) and by then the amateur packet network was already losing its most active proponents.

So, it is not fair to say there was never a lack of applications and than anything that runs over TCP/IP works. It does now, but it did'nt back then!

Actually the pacsat broadcast protocols are not very tightly coupled to
AX.25 as a transmission protocol. Any protocol that can transmit delimited
datagrams could be used as a layer below them.

I'll go along with that. If you can do it on the internet, you can do it
on the packet radio network.
I'm using mailtrax (a windows based internet server) as an smtp and
nntp server for my packet mail and bulls. And I use outlook express
to read/send all my packet mail/bulls. I've got it set up for 2 packet
accounts and 4 internet acounts and a packet news server and an
internet news server.
I've started a bit of a page of what I'm doing, here -
http://www.qsl.net/vk3bvp/ethrax25.htm
It's a bit pathetic at the moment, but I will get around to doing it up
a bit.
Anyway that's just one of the things I'm doing with tcp/ip at the moment.
And of course you can do it all with linux as well.
The important thing is to have fun doing it :-)

You cannot know everything. But NFS is such an application. It uses UDP
to send data between two systems that have a session in the sense that one
knows about a filesystem on the other, and opens and closes files on it.
But there is no real session as in TCP, and the server system can be
rebooted between client requests without losing anything.

Multicast is on the IP level. UDP can be used with multicast, TCP cannot.
Because TCP assumes it is talking to a peer that will send it
acknowledgments, that confirm the reception of sent data (which can then
be deleted from a queue). This isn't the case with multicast because one
receiver may miss data that another one got.

In the case of TFTP, it might be that TCP hadn't been fully invented yet
when TFTP was specified, but I'm too lazy to look it up.

The reasoning behind NFS was that the overhead of TCP connections would
needlessly impact performance, so NFS ran on top of UDP with a homegrown
reliable protocol that wasn't very sophisticated. With V3 came NFS/TCP,
which is indeed much better. Keep in mind NFS is also stateless, so a
stateless transport like UDP perhaps seemed to more sense early on.

> that a solution that needs multiple machines is not going to make it when
> you want many packet radio amateurs as users of your system. That is
> only for the nerds.

> Rob

Rob,

I think my observations are right on target. There are perhaps
several reasons tcp/ip over ham radio has not become popular.
The fact that the usual (e.g. Windows, Mac) applications could
not be used is one reason. The difficulty of getting *NOS setup
and running properly is another. A Linux solution is not of
interest to most hams. The applications embeded into the various
*NOS executables are either not easy to use, don't work well,
or do not exist at all. One expects, for example, to click on
a file and attach it to an email message.

A different architecture is needed.

Win95 and Win98 with both run virtual DOS machines.
They work just as well as real DOS machines to run NOS as an
interface/gateway etc. Just takes a second ethernet controller.
This machine is running that configuration. Ethernet controller cost me
$7 at Frys a few months back. Now I don't have the problem of
"all applications must be bound into the NOS memory image."
All the usual Windows applictions work over ham radio tcp/ip
AND over ham radio BBS links.

Your comment applies to Unix solutions as well: very few hams
are interested in running Unix, other than a few nerds.

To get hams to use tcp/ip there needs to be a better solution than either
of these. It must be simple to install and simple to configure and simple
to use. It must run in Windows. SNOS is an experiment in that direction.

Are there any other solutions available?

NcWinPTC is free, and works very well with the SCS PTC-II and IIe.
Another super Windows based program for the PTCII/IIe is XPWin. There
is a fully-functional demo version available for download. Links for
both programs are on the SCS Website. I have used both programs and
both are excellent.

Yes, at least two of them. From SV1AGW and from the Flexnet group.
These don't need the hackery you propose, they just implement a network
interface that runs packet protocols (just like the Linux solution).

They are available for about two years now, but they came too late to
leverage (popular buzzword) the initial developments in amateur TCP/IP into
the average-ham shack.

There was a painful gap between the introduction of Windows 95 and the
usability of its TCP/IP networking on amateur packet radio. One would
have expected the TNC manufacturers to step in with a TNC with modified
firmware to provide a PPP interface on the ASYNC end while running IP over
AX.25 on the radio. Then, it would have been possible to use the standard
dialup networking of Windows 95 with amateur radio, with the addition of
only a small control-panel program to perform some settings of the TNC.

But no, they all seemed to be glued to KISS and Hostmode.

Have looked at both.

Did not see how they handled the nntp <-> bulletin
and smtp/pop3 <-> personal message translations.

Perhaps I missed this. Will check them out again, it has been a year
or so since I last looked at them. Flexnet was not an option for me
since I have no TNCs that could support 6PACK. I could not figure out
how to make the SV1AGW stuff do what is needed.

One $7 ethernet controller is a lot cheaper than replacing a half-dozen TNCs.

Have you looked at SNOS to see what is needed?

There is a good deal more required. We are in complete agreement of
course on the direction taken by the TNC manufacturers. I've talked
to two of them, and their response was essentially that making changes
like this is very expensive (I agree) and that there is little market
pressure to make those changes (I also agree).

> But no, they all seemed to be glued to KISS and Hostmode.

We are stuck with what is available in the TNCs. This should not stop
us from doing interesting things, it just makes the problem "more interesting."

I've been running a Linksys router for about 2 months now. That's
really the way devices need to arrive these days. It plugs into the WAN
on one end, the LAN on the other, and is configured with a Web page.

Web interfaces have been done before (My Hawking iRouter did the
same thing for the same price, but only with modems). Cisco did it
a long time ago (but who the heck cares at their prices).

Cheap, and needs to do the job.

That's really how Ham gear must be designed today. If it has a Web
interface, it will sell like hot cakes (just ask Linksys, and Hawking) :-)

I haven't opened up my Linksys yet, but I'm dying to see if it is a
modern CPU.

At least one manufacturer of controllers for digital ham radio
has this under consideration. I would sure like a PACTOR and
CLOVER (and etc.) HF modem with an ethernet port instead
of serial port.

> That's really how Ham gear must be designed today. If it has a Web

Thus the experiments with web based remote admin in SNOS.
The idea works fine. Needs a lot of code to do everything needed.

Have you ever heard of the MCB-152? Yes, some Europeans actually do some development from time to time :-) The MCB-152 is a general-purpose micro-controller board (based on a special Intel 80c152 microcontroller with special communication gear on board). Our first firmware project was the KISS-firmware (just to get the toy usable). Next, the SLIP firmware was developed (now going into its third revision). What makes this SLIP firmware so special is that it behaves as an ordinary telephone modem (AT command set) towards the modem and applies classic Packet-Radio to its radio-port. Result: you can
simply use the generic modem driver that comes with your OS (Win9x, NT, W2K, Linux, MacOS, ...). You setup a dialup connection like you do to reach your ISP and there you go! No proprietary drivers to install, no tedious configuration (you already have done it once to get connected to the Internet), what more could you ask for?
You could have a look at our generic project page at http://www.qsl.net/on1blu. From there you will also find links to the MCB-152 project page and the like.
Our opinion is: users should be able to recuperate their genuine Internet software to travel the ampr.org network, for servers we prefer Linux (since it's free, of course). To help new SysOps, we developed a step-by-step course and provide all our own configuration files as a sample (freely available from the website mentioned above).

I'm using the AGWPE on APRS and it is kind of neat to interface with. Right now I have an application that connects to the AGW server on its port 8000 and feeds the data into a MySQL database (just now working on the mysql database interface and table design). I think the limitation of AGW is that if you want to use TCP/IP on the radio port, you must have some other means to get to other networks such as ROSE, NETROM, etc. That is, it only talks to things it can ARP with, if I'm not mistaken.

While the AGW interface is kind of neat, I will be switching to the aprsd I/O code to feed my database in the interest of speed, and a one machine solution.

Oh well...

PakRatt 2.0 has Y2k issues as well as it wasn't 32 bit aware. We purchased the source code to it back in March of 1999 and made the fixes.

You can update to Pakratt 2.1 for $30 or up to Pkterm '99 from PakRatt for $50. Pkterm '99 is full 32 bit and will run on all 32 bit version of Windows, include Windows Me and 2000

I'm sorry, but I have to disagree with all of the stated opinions as to why amateur tcpip never "flew"... Everybody's got opinions... Here's mine:

Amateur tcpip never "flew" because of the hostile, anti-ham attitudes and actions consistently displayed by amateur tcpip buffs, over the years. The constant foundationless vapor-hype, coupled with the almost total lack of accomplishment from the amateur tcpip community went over about like feces in the punch bowl. The constant insults and accusations directed against the general Ham community didn't go over too well, either.

That's why the great majority of Hams wouldn't touch amateur tcpip with a ten-foot pole. It might (or might not) be great, but that doesn't really matter after the way amateur tcpip buffs have alienated the general Ham population over the years. Nobody wants to be associated with them, no matter what they may or may not have to offer.

They pissed in the well, and nobody was impressed.

OK - but all the applications that I have seen which use UDP are either of the query/response type (such as DNS) or of the unsolicited information type (such as for dynamic routing). I've never seen nor heard of an application which takes multiple packets. I thought UDP opens a socket but NOT a stream like TCP does. If one wants to create a virtual stream with UDP, it's possible, but that requires that such be designed into the data structure being transferred. TCP already handles that intrinsically, but UDP [by itself] doesn't.

I did look into multi-cast a bit. And, the funny thing is I think it would
be very well suited to transmitting APRS data across the country. The
issues seem to be...

1. Most of the new multi-cast work seems to be with IPV6, and not old
IPV4 multicast. So, I'm not sure how well all the code is maintained.
(This is just a perception of mine, so maybe I'm wrong here.)

2. Windows and Linux both support multicast. However, you need
a Unix machine of some kind to run 'mrouted' which allows you to tunnel
between parts of the net which don't support multicast.

3. But, yes you can run multicast routers on your local LAN, and
then link to other people also running multicast routers. And somehow,
when you send broadcast packets, the routers are supposed to figure
out somehow how to get the bytes from here to there.

4. The application programming API for multicast is super simple
and easy to understand. Writing code is no big deal.

5. Multicast doesn't guarantee delivery. It's more like UDP than TCP/IP.

6. I believe mrouted is supposed to be smart enough only to route the
packets to those who want to hear them. So, if say, you wanted to hear
all the APRS packets in New York City, but you were in Las Vegas,
somehow, mrouted would get that data to you. I have no idea how
well this works. Supossedly there was a network one time running
ip multicast called the mbone -- but I can't find many references to it
lately.

7. Obviously there is zero code for any of this right now. Somebody
would have to do some programming to put all this together.

I have to go out in a minute so it won't be detailed.
I thought that SNOS used BPQEITHER to talk to the packet network via
another computer that has normal packet interfaces. Why not add a normal
packet
interface to SNOS.
Of course they have nothing in common. The idea of using ethrax25 is as
interface
option like bpqeither. To be used as well as or instead of it with SNOS.
If you have eithrax25 you don't need to connect to another SNOS computer,you
can connect to any *NOS computer over packet.
I just thought it would be a good interface to have as well as bpqeither.

Good isn't it. Why tie yourself down to one bit of packet software.
I use Mailtraq which does that and a lot more.

> So it doesn't solve the most important issue: maintaining compatibility

JNOS<>Mailtraq does that too, but you aren't tied to using them.

As usual, Hank is discussing in circles again. First he wants examples of
how TCP/IP applications can be used with packet radio, and once you give
them he starts talking oldfashioned packet radio protocols again!

Who would ever want this translation in the client software?
In a TCP/IP network, the clients are talking to corresponding services
on the network and server systems. Your BBS will be running INN and
sendmail (plus probably a POP3/IMAP server), no hamradio BBS stuff.

When there has to be any gatewaying, it will be done by the BBS system,
not the user software. Of course.

>Have you looked at SNOS to see what is needed?

I have never had a DOS-based system at home. Sorry.
My system is now running Linux, and I have NET running for the conversions.
I have not seen the need for anything different yet.

As others have noted, for the Internet market boxes like this are available
in many forms. And the software that would be needed in a TNC like this is
mostly available for free.
Integration to a product that can be sold may cost some money, and of
course it is easier to keep your customers dumb and not let them taste any

networking, or they will become hooked.

This worked well when the alternative was telephone BBSes, essentially the same stuff as the packet radio system.
Too bad they then got the Internet, and saw the light. That meant the end of telephone BBSes, and ultimately the end of packet radio as well.

That will be very expensive for them as well.

MURS may be a Part 95 service, but it's a splinter off of Part 90.
In any case, both Parts 90 and 95 have radio certification procedures
that amateur radio does not.

> > Anyway, you're apparently not aware of the better Part 15 services,

Turnkey amateur radio operation in 900MHz and 2.4GHz? There's a flood of
Part 15 operation in those bands (my WaveLAN 900MHz network and Proxim 2.4GHz
network, and my 900MHz cordless telephones count) - but there is a dearth of
turnkey *amateur* equipment for these bands. I don't confuse the idea of "amateurs
using Part 15 consumer gear" with "amateur operation".

I believe you either did not understand my comment or chose to ignore it.
My point, simply, is that the 2W power limit of MURS is already being flauted
by the scad of users that use modified amateur radios for Part 90 operation.
You're touting the power limit as an advantage and I'm noting that the power
limit holds little stength.

Agreed, there are some inexpensive FRS radios. However, these are extremely
simple radios without a connector for an external antenna or audio.

Well, I take it you haven't actually listened to the "color-dot" frequencies?
The FCC proposed the MURS to deal with the fact that unlicensed use of the
color-dot channels was far out of hand.

95.603 Certification required.

* * * * *

(g) Each Multi-Use Radio Service transmitter (a transmitter that operates or is intended to operate in the MURS) must be certificated in accordance with 90.203 of this chapter.

Oh, look at that. The proposed rules for MURS actually reference Part 90. Am I wrong or were you ignorant of the rules, Stewart?

Rob, to make any such operation useful, things must interoperate.

> Who would ever want this translation in the client software?

Who was talking about client software?

> In a TCP/IP network, the clients are talking to corresponding services
> on the network and server systems. Your BBS will be running INN and
> sendmail (plus probably a POP3/IMAP server), no hamradio BBS stuff.

And how will it then interoperate with the existing services?
Without that interoperation, it won't work.

> When there has to be any gatewaying, it will be done by the BBS system,
> not the user software. Of course.

"the BBS system" ... "user software".
This is the same old song that we have heard for years.
Why must these be different things?

So your claim is that NET/ROM is not "networking", APRS is not "networking",
DX cluster is not "networking"? Didn't think you were a tcp/ip bigot.

I think you should look at the web pages before you "think" too many
wrong things. SNOS has ax.25, NET/ROM, tcp/ip, can talk to TNCs
on serial ports, supports HAL P38 and PCI4000 controllers

Several "chat" applications have been available for about 10 years.
All I'm familiar with do what you mention above, and more.

You could have put that more simply:

TCP/IP over amateur radio never caught on because to properly set up a network requires COOPERATION by the participants - a trait that amateur radio licensees generally lack.

"Too many cooks spoil the broth."

For amateur radio, it's more like:

"TWO cooks spoil the broth."

Yes, that is a great solution. I have discussed with PA0HZP about a
successor to the OptoPcScc card (we saw the problem of higher speeds and
obsolescence of the ISA bus), and we have made some basic sketches of a
single board using a Motorola 68EN360 that would do the above, but with an
Ethernet interface to the PC or Mac or whatever.

Just standard IP-over-ethernet on the PC side, and standard AX.25 on the
packet radio channels (3 channels up to 2 Mbit/s fullduplex on this chip).

One American packet equipment manufacturer was informally interested in
reselling this.

We never continued this project because we believed there would not be many
hams that would consider the cost acceptable (many even thought the SCC
card was too expensive), and there would be too much risk in having the
required PCB (at least 4, probably 6 layers) made in sensible batches, and
not selling all of them.
Or having problems with the availability of the chip (very common problem
with Motorola).

But later I have seen a German design that was essentially the same thing.
I don't know if they have made it into real availability.

3920. Final Update - DCC Orlando, FL Sep 22-24, 2000

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-18 00:00:00 UTC
From: srbible@gate.net
Message-ID: <39c67807.26327086@news.gate.net>
Source record: 10918

19th Annual ARRL/TAPR Digital Communications Conference
Orlando, FL - September 22-24, 2000

** Final Update 9/18/2000 **

Counting down the final days until the 19th Annual ARRL/TAPR Digital Communications Conference this weekend in Orlando, Florida. For detailed
information about the conference, please visit the official DCC web page at
http:www.tapr.org/dcc.

Registration for the conference will be taken at the door. Friday registration is for an entire afternoon APRS activities, demonstrations, and
presentations. Saturday registration includes conference proceedings, lunch, and a full day of presentations. Saturday night includes Banquet,
dinner speaker, and prize drawing. Sunday registration is for the PICmicro
Design seminar.

DCC Social:
Please join us Friday evening at 7:00 PM for a social get together time.
The social is generously hosted by the Packet Radio Users Group of Japan
(PRUG).

PRUG Presentation:
Friday night the Packet Radio Users Group of Japan will present talks on
their progress on high-speed digital networks in Japan.

Saturday Night Banquet Speaker:
Mr. Doug Campbell, of Triton Network Systems
(http://www.triton-network.com)
will be our DCC Banquet Speaker. Triton Network Systems is located in Orlando, Florida.

Vice President Product Management, Marketing, & International Business as
Vice President of International Sales, Marketing and Product Management, Mr.
Campbell leads the assessment of global community needs and spearheads the

development of Triton Network Systems' product and marketing strategies.

Mr. Campbell cultivated his management skills in sales, marketing and product development working 17 years for Nortel Networks. While based in Singapore, he built a multifunctional pan-Asian team, which successfully captured a 100% market share with MCI-WorldCom Asia, successfully introducing a number of new products. Prior to this, Mr. Campbell was instrumental in the establishment of an SDH broadband equipment joint venture in China and served as a member of the company's Board of Directors.

Mr. Campbell received a Bachelor of Engineering Physics degree from the Royal Military College of Canada in Kingston, Canada, and a Master of Business Administration from IMD (University of Lausanne) in Switzerland.

Banquet Prize Drawings:
Grand Prize – Kenwood TM-D700A (donated by Kenwood)
2nd Grand Prize – Palm VII Personal Digital Assistant (donated by TAPR)
Two Motorola Oncore M12 GPS Evaluation Kits (donated by Synergy Systems, LLC)
Microchip PICSTART-PLUS PICmicro Programmer (donated by Microchip)

PIC Seminar Prize Drawing
Microchip MPLAB-ICD (donated by Microchip)

Project and Demonstration Room:
The DCC is a place where people can talk about their projects and gain ideas for new ones. The Project and Demonstration Room has become a recent DCC tradition where people can bring and display their projects. The room will be located next to the registration room and across the hall from the main presentation room. The Project and Demonstration Room will open at registration time and be closed (locked) 11:00 PM Friday and Saturday night.

Map and coordinates:
A map of the conference hotel and coordinates are available at ftp://ftp.tapr.org/dcc/2000.dcc.hotel.map.pdf

Speakers:
The following is a list of presenters. PDF version available from ftp://ftp.tapr.org/dcc/2000.dcc.speakers.pdf

Speaking schedule (subject to change) is available from
ftp://ftp.tapr.org/dcc/2000.dcc.schedule.pdf

APRS Seminar - Friday September 22, 2000

John Ackerman, N9UR APRS WG
Steve Bible, N7HPR T-238 Weather Station

Thousands of Hams cooperated to build the AX25 packet network and HF
forwarding nets that the tcpip goons showed such intolerance about and
actively worked to undercut. - So your "theory" does not hold water.

You are just indulging in some of the very behavior I described...

"The constant insults and accusations directed against the general Ham
community didn't go over too well, either."

I guess that sort of behavior is so deeply ingrained that it has become a "knee jerk" or just plain "jerk" reaction by tcpip buffs such as yourself.

Thank you for the direct verification of my opinion. It's nice to be proved right.

The cost of writing software to do this is quite large, since essentially
none of the bits exist. Perhaps someone will take on this project.
SNOS, as I said, is an experiment in what such software might do.

> > > > As far as I'm aware, SNOS

> list mail is on the internet) or even to a server like I'm running here.

SNOS is not a client.
It is middleware.
It has a client side and a server side, but it is not itself a client.

You could, of course, use it just for it's servers: smtp, nntp, ftp, http,
pop3.
It also has a client side, so it can talk to servers.
You might also call it "agentware" ;-)

You don't look at "the SNOS window", or type at it.
It links those things you are talking about together, so they work with
the existing ham radio network (BBS and tcp/ip). It could link most
anything: for example I use the pop3 client and server as a mail collector
and router. It can snarf up mail from my various pop3 accounts and from
the ham radio BBS network, I can then access it all from one place. It
knows how to route the outgoing smtp mail to the correct smtp server,
and the outgoing BBS mail to the correct BBS system.
Middleware. Both client and server.

SNOS is not a BBS.

> Or does everyone have to use SNOS to be able to use, say, outlook express
> to get their mail.

SNOS is not a BBS.

> I tend to split packet (or internet for that matter) into two types- server
> and

SNOS is not a client. Sorry, I thought that was obvious. It's middleware.
Use any clients you like, for the appropriate protocols.

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=441378461

Low reserve. Bidding started at $90.

eBay auction of 2 Meter All Mode rig (covers 144-148 Mhz). Good to very good condx. MC-46 Tone/VFO mic included. It's great for autopatch, and you can QSY right from the mic.

This is a mobile unit, and will, of course, require a power supply for base operation.

Thanks & 73,

Chuck

3925. Digital Repeater

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-18 00:00:00 UTC
From: "Steve Sampson (K5OKC)" <ssampson@nospam.radio-link.net>
Message-ID: <ssdmj2m68h44bc@corp.supernews.com>
Source record: 10923

One of the projects I am working on (I just received a repeater freq
coordinated as a digital one) is to build a digital repeater.

What is a digital repeater?

Rather than FM voice modulation, the voice is sent through a CODEC
(A/D, D/A) and then through a vocoder to a digital compressed form.
The vocoder quality has been improving, and is now at the point
where users consider "good enough" at low baud rates. The current
vocoder by DVSI (www.dvsinc.com) operates from 2000 to 9600 bps,
with toll quality (phone/radio) at 4000 bps. Not only that, the vocoder
has FEC available. For example, a voice rate of 4000 bps can be selected
and 800 bps of FEC selected to provide a 4800 bps signal to the
transmitter. I've selected 4800 as a candidate, because it is about the
highest speed a voice channel can accept before internal modifications
are required. I've selected Linux, because it offers experimentation
at the least cost. Those with Microsoft subscriptions could easily
go the same way with a Windows or Windows CE platform.

What good is this?

Digital voice that can be routed over IP offers enormous potential.
Standard radio parts can be interfaced to a Linux box using a
Soundcard to encode and decode the 4000 bps signal (4800 with
FEC) and control the repeater through a Web interface. Once the
digital voice is sent over IP, anything (linking) is possible.

Voice and data can be combined. The radio design offers a capability
to use data to best effect. A small GPS engine can be combined with
Callsign or other messages to be viewed in a small LCD window.
No need to identify every 10 minutes, you identify every transmission!
This also provides a very intelligent squelch! Don't like to listen to
Jimbo on his way to work every morning? Put him in your killfile and
the radio stays quiet... A repeater could easily show who is in range,
if radios sent out APRS type packets with their callsign and position.
OK, I'm dreaming (nightmare), but you get the idea...

What kind of experiences have people had with 4800 bps with
typical Ham radios?

Best Regards,
Steve/k5okc

With my answer he can fish, with yours he only gets one meal.

Since most new IP enthusiasts only last a few days, I generally just
recommend they pick any IP address above 64 in their states octet,
as those addresses are not coordinated in the U.S.

There are many reasons why not. We have recently been discussing them
here - which YOU were obviously not aware of.

radio.

Like I said - people don't want to deal with licenses. The also don't
want to pay a lot of money. FRS radios cost as little as $20 at Wal-
Mart - if MURS radios can come anywhere near this number, it WILL be a
success.

What an insight you have!

The PROBLEM is, at 1200bps they don't work very well. Most all
applications have all been written to work at ethernet speeds. NOBODY
wants to sit around and wait for things to happen. The trick is to
come up with applications that are useful at 1200bps. That's what I'm
working on.

Looks like the proper tense should be
"was" or "might have been" a Part 95 service ...

RM-9157

Adopted: April 18, 2000
Released: April 20, 2000

---

3. Section 95.601 is corrected by deleting reference to the "Multi-Use
Radio Service
(MURS) subpart H" to read as follows:

* * * The Personal Radio Services are the GMRS (General Mobile Radio
Service) subpart A, the
Family Radio Service (FRS) subpart B, the R/C (Radio Control Radio Service)
subpart C, the CB (Citizens
Band Radio Service) subpart D, the Low Power Radio Service (LPRS) subpart G,
and the Medical Implant
Communications Service (MICS) subpart I.

---

5. Section 95.605 is corrected by deleting the reference to "MURS" to
read as follows:

Any entity may request certification for its transmitter when the
transmitter is used in the GMRS, R/C,
CB, IVDS, LPRS, or MICS following the procedures in part 2 of this chapter.
Medical implant transmitters
shall be tested for emissions and EIRP limit compliance while enclosed in a
medium that simulates human
body tissue in accordance with the procedures in Sec. 95.639(g). Frequency
stability testing for MICS
transmitters shall be performed over the temperature range set forth in Sec.
95.628.

---

10. Section 95.649 is revised by deleting the reference to "MURS" to read as follows:

No FRS, R/C, CB, LPRS, or MICS transmitter shall incorporate provisions for increasing its
transmitter power to any level in excess of the limits specified in Sec. 95.639.

---

11. Section 95.651 is revised by deleting the reference to "a MURS unit" to read as follows:

All transmitters used in the Personal Radio Services must be crystal controlled, except an R/C station
that transmits in the 26-27 MHz frequency band, a FRS unit, a LPRS unit, or a MICS transmitter.

1200 bps? Are you stuck in 1983 or something?

Let's look at the RFCs. When the main application protocols were designed,
the target was existing dialup connections. e.g. smtp/pop3/nntp. Those
connections
were just moving from 300 baud links to the faster 1200 baud links, 1200 baud
modems for home use were just becoming available (at $350 each), inter-computer
links still mostly at Bell 202 or 64k leased line speeds.

Time frame is middle to late 1970's.

Guess why all those protocols are text based, are required to run
over 7 bit connections, and have mostly very compact command
definitions. They would run just fine over PACTOR-II links.

That's news and mail.

> NOBODY
> wants to sit around and wait for things to happen. The trick is to

So what do you have in mind, that isn't news and mail or it's equivalent?

I'm not sure what you are suggesting. Could you explain in a bit more
detail what that interface would be / do? As far as I'm aware, SNOS
and etherax25 have nothing at all in common, they do different things.
You could, perhaps, use etherax25 to connect your Winsock over
ham radio to another machine running SNOS ... and use a serial port
and TNC instead of that second ethernet controller :-)

Not what SNOS is about ...

> All you have to do is install the driver, hook up your KISS mode TNC
> and config your software (that you're already using on the internet).

As far as I was aware, etherax25 allows you to stuff tcp/ip
out over a TNC. No services, nntp <-> bulletin translation, etc.
So it doesn't solve the most important issue: maintaining compatibility
with the existing packet network applications. SNOS my experiment
to do this: provide the bridge between the existing BBS network
protocols (e.g. forwarding) and the tcp/ip protocols (e.g. nntp
distribution).

I'm not real sure of exactly what happened here. A lot of people
got on the tcpip bus when it passed through here some years
ago, but got off again just down the road.

> The fact that the usual (e.g. Windows, Mac) applications could
> not be used is one reason.

I think that would have helped keep people interested. And maybe
even given a reason/excuse to improve the network.
The client software of the day was pretty spartan.
Server software doesn't really matter much.

> The difficulty of getting *NOS setup
> and running properly is another.

That wasn't a problem around here. We'd have generic set ups that
only required a search and replace for things like callsign(s)and IP
addresses. The rest can be fine tuned as the users learns about it.

> A Linux solution is not of
> interest to most hams.

It's not ready for the real world yet.

> The applications embeded into the various
> *NOS executables are either not easy to use, don't work well,
> or do not exist at all. One expects, for example, to click on
> a file and attach it to an email message.

This is a real problem. As long as I don't use HTML or attachments
I don't have any problems sending out packet messages using
internet software (OE) and no one knows I'm using it unless I tell
them.

>
> A different architecture is needed.
>
> Win95 and Win98 with both run virtual DOS machines.
> They work just as well as real DOS machines to run NOS as an

I like the use of ethrax25 for a client packet station. All it takes is a
serial port, a KISS TNC and the ethrax25 software and you can run

all your windows tcpip (internet) software on packet. You can make
the windows aps as simple or complex as you like. Stuff like
Oulook Express, Internet Explorer and Netscape are easier to set up
for this than they are for typical dial up internet use.

I did it a bit different to that. I used a nul modem cable and linked it to
a KISS port on my BPQ/JNOS computer. JNOS can act as an IP router and
a way of getting mail to/from the BBS network onto the local tcpip network.
I could have have done it on one computer, but I like to have FBB and JNOS
running on their own computer and not on the one I use for running new
(read sus) software.

> All the usual Windows applictions work over ham radio tcp/ip
> AND over ham radio BBS links.

Same here, but I don't need as many card slots and using serial ports
works out a bit cheaper (but a lot slower) for me. Finding spare card slots
are my biggest problem.

>
> Your comment applies to Unix solutions as well: very few hams

I'd like to see an interface option like ethrax25 for SNOS. The code is GPL
and freely available. What I really want is JNOS with an interface to the
windows tcpip stack. Then it would be sort of like Wingate and Mailtraq
rolled into one, but with all the packet interface options.

>
> Are there any other solutions available?

Guess you knew I was going to say ethrax25.
To my way of thinking it offers the easiest way of getting windows
end user client tcpip software onto the packet tcpip network.
All you have to do is install the driver, hook up your KISS mode TNC
and config your software (that you're already using on the internet).

I've had a quick look at AGW, but only being able to use
the tcpip side of it for 45 minute (without registering it) has put me
off doing tests with it. Maybe one day.

DX-cluster and APRS are just that type of applications that can live with 1200 bit/s, in which messages are usually generated at so low rates that the link is idle between messages and there is only a small risk that queues are formed at one end of a link. Applications that by design require queueing (e.g. store and forward) destroy the responsiveness of any interactive applications, unless some QoS concept is used to prioritise the traffic by a frame by frame basis.

Applications similar to GSM cellular phone SMS (Short Message Service) or DX-cluster "talk" functions in which 1 .. 3 lines of text is delivered in more or less real time so that an interactive discussion can be maintained. But even in this case the link loading should be kept low even during peak hours to maintain a usable response time at these extremely slow half duplex links if more than one link is involved in the transfer.

I'm suggesting that SNOS should be able to talk directly to the Windows
TCPIP stack rather than having to go out one NIC and back in via another
one.
Just like all the internet software I know of does.

> > > As far as I'm aware, SNOS
> > > and etherax25 have nothing at all in common, they do different things.

That's right, more or less.

> > > You could, perhaps, use etherax25 to connect your Winsock over

> > > and TNC instead of that second ethernet controller :-)

Yes. For a user (client) all that's needed is ethrax25 and a serial port
and
they are surfing the packet radio net in a matter of minutes and a few
reboots.

It doesn't have to be SNOS, it could be *NOS for private mail and bulletins
that have been through rewrite and alias (so that bulls end up like mailing
list mail is on the internet) or even to a server like I'm running here.

I have actually downloaded SNOS a couple of times. It seems to offer more
now than when I last looked at it.

I'm sure in the past it wouldn't run without bpqether and there seems to be
more features now. If I had a couple of spare card slots and NICs I would
be temped to give it another look. If it talked directly to the Windows
tcpip
stack and to BPQ via a loopback port I'd be running it now.
But for now I get more features with less hardware with what I'm running.

OK, then how do end users get their mail and bulls from your SNOS server.
Or does everyone have to use SNOS to be able to use, say, outlook express
to get their mail.
I tend to split packet (or internet for that matter) into two types- server
and
client. SNOS would be a good server if you had their hardware to run it.
But I don't see it as a client solution.

And mailing lists and you can get your mail with a browser if you were
silly enough. The remote logging is handy. It's all compatable with the
existing packet nertwork or I wouldn't be using it.

I might have a look on my next lot of days off if it's not good fishing
weather.
I've got it installed on this computer with one TNC cofigured. I just
haven't
looked at the tcpip side of it.

...But that is NOT advised in my area (Los Angeles), and I believe that in parts of Ohio, such numbers are also assigned.....

The Los Angeles area does have coordinated IP addresses with the third octet being greater than 64 in value. Such was done before Brian changed the rules.

Yes, you're wrong. Why wouldn't it work? How would it even
know what the hardware interface was, since AX.25 and the
drivers that go with it are a fully-integrated part of Linux?
It sometimes sounds like people don't really understand how
real operating systems do this stuff...

I had a look at the source for xastir, and all it does is open
an AX.25 socket and use it. Which is exactly what it should
do. It has some sound alert facilities that will fight with
the sound card modem code, but that's another matter.

> I any case how is Soundcard Packet in Linux?

Written by the same folks who did FlexNet with sound cards.
Same algorithms, same hardware.

At 9600, you would like 80 ms. or better. The little TEKK rigs can
do 50 ms. I find that many synthesized radios can actually manage
100-120 ms. without problem (e.g. tm-421).

Using a soundcard also isn't going to make you happier... you need audio
coverage down to a few Hz or preferably to DC. Soundcards are designed
for audio and smallish speakers. You may be able to increase the values
of coupling capacitors, but with some bad luck there is filtering that you
cannot work around.

I have once converted a commercial FM transceiver that had really true FM
in that a small variable DC voltage on the line input would actually sweep
the output frequency over a few KHz range. True DC coupling of the
modulation. I was also able to replace a series capacitor in the RUH modem
with a wire bridge, and have never seen such a nice eye pattern on the
scope. It looked just the same as a local loopback, no "jittering" and all
lines going through a very small crossing area.

Hold on there bobalouie. I'm hope Linux overtakes. I'm glad to hear it
works AND someone is actually doing it. The thing is, I have Flex
working in DOS/WIN but can't find a APRS program fer it. What better
than to hear someone actually using it. The combo I am asking about is
Linux AND Soundcard AND APRS. If we can an easy to use home install
with Linux, it will fly. I like is robustness yet it needs to work for
mom too. :)

That's cool.

I guess what I'm asking for are the adantages of running soundcard/APRS
and such on Linux compared to Windose.

Crystal-controlled rigs tend to be faster than PLL synthesized in general,
but even crystal-controlled transmitters run into T/R and R/T turn-around
time limitations in the audio chain. Just because the radio is spewing RF
doesn't mean it can actually modulate it properly, and sometimes the radio
will be deaf long after it stops transmitting.

I found the UHF Motorola Flexar/Maxar series work well at 70mS with no
modification.

I don't think Brian handles anything now eh?

The object is to link radios. If you're never going to hook it to
the Internet (Chuckles says this is Bad! ...bad, bad...) then who
really gives a squat eh?

I think your BBS club is a proponent of non-wireline, so WTFO eh?
Pick a number, get all your club members to use it, "be happy..." eh?

amprhosts is for Internet routing. If you are against that, then what's
wrong with using 10, 192.168, 45, or even 24 eh?

Are you saying it is alright to hook Ham radio up to the Internet eh?

The modified trx I described in the other message (AEG Telecar TE) is
routinely operated at 30ms. Just to give the average receiving station
a bit more to work with. I tested it and it worked fine at 10ms Txdelay.

The TEKK should be capable of the same.

This can be the case when it does not use Kernel AX.25 but talks to a TNC
connected to a COM (tty) port. Some programs do that.
You can circumvent that when you have a suitable emulator for the TNC type
they expect, and interface that via a pty.

>> how TCP/IP applications can be used with packet radio, and once you give
>> them he starts talking oldfashioned packet radio protocols again!

>Rob, to make any such operation useful, things must interoperate.

But no software is required in the client PC to do that.
I get my mail forwarded in SMTP from the local F6FBB BBS and I reply to
it using a mailer that sends it back in SMTP. The conversion is done in
the BBS.

>> Who would ever want this translation in the client software?

>Who was talking about client software?

You wanted to have client software to run TCP/IP on amateur packet.
Server software has not been a problem for a long time.

>> In a TCP/IP network, the clients are talking to corresponding services
>> on the network and server systems. Your BBS will be running INN and
>> sendmail (plus probably a POP3/IMAP server), no hamradio BBS stuff.

>And how will it then interoperate with the existing services?
>Without that interoperation, it won't work.

Why would I tell you? You will have further comments and remarks about
how unusable or non-USA these solutions are.

>> When there has to be any gatewaying, it will be done by the BBS system,
>> not the user software. Of course.

>"the BBS system" ... "user software".
>This is the same old song that we have heard for years.
>Why must these be different things?

Because the average user is not interested in running his own BBS.
He wants to fire up the system and work. No configuration and maintenance.

Look at the Internet: 99.9999% of the users aren't running any services at
all. They just connect to their provider who runs all the services.

>> >Have you looked at SNOS to see what is needed?

>> I have never had a DOS-based system at home. Sorry.
>> My system is now running Linux, and I have NET running for the conversions.
>> I have not seen the need for anything different yet.

>I didn't ask you whether you ran it, but whether you looked at it
>to learn what problem it solved, and why.

You have discussed that many times.

>So your claim is that NET/ROM is not "networking", APRS is not "networking",
>DX cluster is not "networking"? Didn't think you were a tcp/ip bigot.

NET/ROM provides no networking in the sense that IP does.
In a network, each station has a unique address that can be looked up, and used to make connections to it. With NET/ROM, there are additional addresses involved (endnode callsigns) that no service in the network will provide to the user.
Flexnet is slightly better in that it allows to "locate" a peer that is at an unknown endnode, but worse in that it does not distribute any information about the nodes themselves (so that the user cannot guess which node will be near to the user, based on city name etc)

It is this addressing layer that is so painfully missing in AX.25 "networking". When I want to connect to W0RLI, I first have to investigate where he lives, how the network surrounding him is structured, and at which of the nearby nodes he is QRV. That probably involves a BBS message or even a phonecall.

When I want to FTP to ftp.ucsd.edu, I don't need any of this info. I ask the IP address and send off my connect request.

That is the big difference between NET/ROM (or Flexnet, Rose for that matter) and IP.

I assume you mean GMSK ?

I have had reasonably good results using PI/4 offset DQPSK to
transmit digital voice using a FT290R 2m SSB radio, that was
at 3600 bps, 2400 voice - 1200 FEC. Best DX so far was 70 Km
over an obstructed path and flat conditions.

You can run those AMBE chips at 1/2 their lowest datarate by
throwing away every other frame on transmit and feeding each frame
in twice on receive. The speech quality is not bad at 1200 bps, but
at 600 bps it is awful.

Now that is interesting, and very novel!

A lot of the very lowrate rate vocoder do something similar, they interpolate the Line Spectral Pairs (LSPs).

One scheme I saw sent the Pitch and magnitude on each frame but the LSPs on every other frame and a quality bit to indicate whether the missing LSPs were more similar to the ones before or the ones after the missing ones then used interpolation to fill in.

Also because certain parameters in speech change in a fairly predictable way it is possible to use zero overhead error correction. For example the pitch frequency usually does not change more than about 10% per frame therefore if the receiver suddenly sees a rapid change in pitch it is likely due to a bit error.

There is a lot to speech coding and Vocoders that are used over the Internet are not normally ideal for highly errored radio channels.

Still it is fun writing ones own Vocoder, you certainly learn to have respect for people that do it for a living!

You are much advanced in your thinking. One of the papers you have to do
in signal processing, is a speech compression paper, but most people think in
terms of voice quality when doing their paper. I know the LPC stuff sounds
terrible, but you do get the message across. There is something to be said
about a Q5 signal in normal use, but when "it has to be there on time" and
Q2 will do, well then - slash and burn, interpolate, extrapolate... :-)

Not really... you can do that with MP3 files as well. The MP3 player I am
using has options to control such omission and re-playing, and it can even
be used to do primitive pitch shifting.

Many of the US coordinators are no longer active, do not reply
to requests or can no longer be found at all. This is the situation,
for example, in 44.26. What should one do in that case, other
than "bother Brian". I think it is quite rude to give someone only
partial and incomplete information.

Rebuild your kernel with sound modem support. It works well.
Read the AX25-HOWTO and HAM-HOWTO files.

Newer config scripts have a blanket Ham Radio Support option
that suppresses all ham radio-related configuration items.
You must say Yes to get them.

Yea! but is their an APRS program to run APRS in Linux *and* via
soundcard? Does Xaster or whatever do it?

What are the pros and cons compared to WinAPRS?

Yes I do it! FlexNet works solid but needs setting up in DOS first. I
can't find an APRS program (yet) for it though.

AGW works for some and we're expecting a new version 2000.72 any
miniute. It is easy and works in Windose and prefers 98.

Don't forget I'm talking SOUNDCARD Flex, AGW and Linux. They all can be
used with a TNC (normaly) and require less processor requirements and
may run with more software. But the software is coming along nicely for
soundcard packet. The next version of AGW promises two ports from the L
and R soundcard channels!

Translation: Your soundcard is now capable of being two 9600/1200 TNC's
(That is, two port). More baud rate choices too. Do you have an
old "true FM" rig that's easy to tap into for 9600?

Can you say free (what you have) wireless 9600 baud network? Now 9600
don't sound so bad do it? TCP/IP anyone? Stick that in your
cellular "wirless-web". :) This Inovation can play a big part in
keeping our bands!

Hams do it mobile. :)

3968. SOUNDCARD SAVES PACKET HAM RADIO?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-19 00:00:00 UTC
From: helpfull@my-deja.com
Message-ID: <8q89jc$3ii$1@nnrp1.deja.com>
Source record: 10944

Programs like AGW Packet engine 2000.72 now allow your Pentuim + soundcards to take the place of TWO 9600/1200 TNC's! Combined with a easy to tap into "true FM" rig you can do 9600. 1200 baud requires no modification.

Can you say new and free (with what you may have) 9600 baud network?

Could this revive Packet?

9600 is fast enough for TCP/IP and is wireless. One can use your regular Internet programs. FTP, HTTP, Newsgroups, Telnet ect.

Can you think of some real benefits from this?

Sure, work on faster but don't forget the cost!

Further if you don't think this is in the "spirit" of ham radio or something then simply go and do what you will. Just don't dictate what I do. TO EACH HIS OWN!

Stop the bickering. You'll make us all look bad. If you want to do only CW then I GOT NO PROBLEM WITH THAT! Just mind your own business and don't rain on my parade. I think it's wise to combine various mode/bands whatever for a communication benefit. If we don't focus on some benefits ham radio will soon be sold off.

So I hope you get my point. Don't turn this news into a bar brawl. I hope I'm clear. If you don't want to do anything but RF or CW or Internet or whatever then fine. I HAVE NO PROBLEM WITH THAT! That's OK. I am simply on a quest for benefits. Benefits for emergency, benefits for everyday. Ask yourself; when the fun (of tinkering) is over, what's left?

Plus! While this is a technical hobby, let's not fail to distill THE TECH down (EASY OF USE) so new hams and the not so technical can benefit form it AND GET STARTED. After all guys, intelligence isn't that big a deal compared to communication and caring. Let's stop trying to prove how smart we are and get down to business.

Sorry for the rant. I've just seen too many "bar brawls" when someone tries to promote a real benefit in Ham Radio. What can you say about the soundcard "revival"?

73
God bless
Be well

For Auction on Ebay:

PC Computer System built in a high quality tower case with an Intel Pentium OverDrive 200MMX CPU, Intel Advanced/EV Motherboard with built-in Sound Blaster-16 Sound!, 64MB RAM, 3GB Western Digital Hard Drive, 3.5" Floppy Disk Drive, 16X CD-ROM Drive, Parallel Printer Port, Two RS-232 Serial Ports, Matrox Mystique, 64-bit, PCI 3D Accelerator Video Card, and 101-Key Keyboard. (no monitor, no mouse) As you can see, this is a very clean system, and everything works! Microsoft Windows 3.x/95/98 compatible! This would also make an ideal LINUX system for your home network, firewall, router, etc!

This system would be excellent for your computer programmable/controllable radio equipment, as well as running all those data modem applications!

Just a little over one day left, and currently going at only $77.51, with no reserve!

Thanks,
Bill Crocker
Warren, MI

Even with a true FM rig, your TxDelay will be so high that you will not
be very happy with your results. Think about getting a TEKK data
radio. They are cheap, and they work.

Thank you for the help. It was nice of you.

What trans delay do I need? About what speed in ms, I mean? It seems most fairly new rigs are quick. Let me find a spec. Didn't find it but I think it's about 200ms.

Thanks

From: Len <umina@theuminas.com>
Message-ID: <8qac5ejjd1@bob.news.rcn.net>
Source record: 10871

I am having trouble with getting WINAPRS to work Precision Mapping. The maps improve from the distribution version, meaning they are in color and zoomed out I see the major highways, but zooming in just makes the highways dissapear. The route markers stay.

Anyone else having or had this problem?

/Len

It also serves the unique addressing of amateur radio stations, and
division into subnets. When you want to route along some nodes in the
amateur network (when available locally), you will probably need a 44
address, as all the routes in the routing tables are geared towards the
subnets on that network.
(i.e. in most nodes there will be no route for net 10 or it will point to a
default interface)

Source record: 10873

This was one of the first batch. I built it with great care, and installed a
10-turn POT and did the suggested mods, and tuned it to "prefection"
with an 0-scope. Excellent QRP rig, worth its weight in gold. Unfortunately,
I just don't have the time for radio these days, and I need to pass this
baby on to someone who can enjoy it and get some use out of it.
I am asking the same price I paid for it, because it's worth it, and it's
in good shape. PRICE: $120.00 + $5.00 priority mail shipping.

Email me if interested. Prepayment with M.O. or check preferred.

The objective is to build ham radio network.
Ham radio uses net 44. Perhaps you forgot that in your confusion
between your radios and your telephone.

> I think your BBS club is a proponent of non-wireline, so WTFO eh?

Difficult? Not at all. I've an X11 program (that I grew bored
with so never finished) that implements AX.25 in userland and uses
a TNC in KISS mode to get the bits in and out to the box. Why?
Because the world isn't Linux and my *BSD boxen don't have kernel
mode AX.25. APRS was the second thing I implemented (receive only)
as there are no states to worry about. The first thing was the
equivalent of an AX.25 packet analyzer.

Someday I may finish it. But if I do I'll use soundcard DSP instead
of a TNC as that way I'll be able to add psk31, too.

You are correct, sir.

> Are you saying it is alright to hook Ham radio up to the Internet eh?

Even then - there things like proxies, which allow you to use just one
address. Poor DSL/Cable Modem guys - having to provide gateways to
Radio Networks.

This isn't a bad suggestion, actually. Pick some network 10
addresses, set up your network, get it going (non-trivial!)
and then migrate to "proper" network 44 addresses when you
get them.

Lots of private networks use network 10.

Since this thread is about APRS under Linux, I wasn't worrying
about other OSs. In this thread the world *is* Linux, and any
Linux network program that didn't use kernel mode AX.25 would
have to have an awfully good reason not to.

I'm still waiting for an example...

The usual tcp/ip bigot's idea: if your hosts are not directly on
the internet, then they are not part of net 44. Total nonesense.

> This isn't a bad suggestion, actually. Pick some network 10
> addresses, set up your network, get it going (non-trivial!)
> and then migrate to "proper" network 44 addresses when you

How do you do this migration if you cannot get a response from
the appropriate address coordinator? It is a totally useless suggestion.

You might better use an address in the appropriate subnet of net 44,
then you will be able to communicate with other hams running tcp/ip.
Perhaps they will be able to tell you what to do about that address
coordinator who is not doing his job.

> Lots of private networks use network 10.

The discussion was not about private networks, but about the
ham radio tcp/ip network aka net 44. Lot's of private networks
also use subnet 192.168. Has nothing to do with anything.

It wasn't mean't to be a political or religious suggestion, or even
one to encite self-oscillation in a BBS club. It was only mean't
to be a suggestion, that if you want to set up a radio IP network,
and your coordinator is dead, missing, or can't be bothered, that
you might pick some other number, and develop your interest.

> How do you do this migration if you cannot get a response from
> the appropriate address coordinator? It is a totally useless suggestion.

You are not going to find the address coordinator via your IP radio
station. You don't have an IP station until you find the coordinator.
Meanwhile, rather than wringing your hands on what to do, the most
obvious thing to do (after a lengthy missing-persons report on the
coordinator) is to just have fun.

> > Lots of private networks use network 10.

I don't want to relive ancient history, but go back to the day that
the class A resource was given, and ask yourself if your not
being just a little bit stupid in continuing to use it. A lot has
occurred in IP networking since those long days ago.

The situations are completely different. Since DOS/Windows
has no native AX.25 support, there is no standard, and every
software package must do it more-or-less monolithically,
from scratch.

The FlexNet API is published, so you could write your own
FlexNet APRS program if you wanted to. This would be one
way of getting the application you want. Building on the
FlexNet drivers, it would be oblivious to the underlying
network interface. Just as all FlexNet apps are.

You get this for free under Linux. The question is not
"APRS + soundcard + Linux", but "APRS + Linux", because
the network is already there, the interface to the
outside world is in place, provided by the OS, and
applications simply use it. The interface is well
known - BSD sockets, with AF_AX25 as an available
address family.

Applications don't know whether they're talking to a
KISS TNC or a sound card or an SCC card or a Baycom
modem, and they don't care. It just works.

Clarification perhaps?

"can do" means "I have links using TEKK radios
running with txd of 50 ms."

"can actually manage" means "I have one link using said radio
running at said txd".

> Crystal-controlled rigs tend to be faster than PLL synthesized in general,

Very true. The Kantronics D4-10s can run a bit faster. With very good
paths we have been able to go as low as 40 or sometimes 30 ms. at
9600 baud. Have not had good luck at 19200 though, even with very
good paths.

This would make it very hard to connect your new host into the
existing tcp/ip network. What is the reason to *not* use an address
in the local subnet?

> > How do you do this migration if you cannot get a response from
> > the appropriate address coordinator? It is a totally useless suggestion.

The point, Steve, is a simple one. For some subnets, there is not
a coordinator. If nobody tells Brian about this, there never will be
a coordinator for that subnet. So you might as well go directly to
Brian and get things fixed.

> You are not going to find the address coordinator via your IP radio
> station.

That's for sure! The coordinators for my local subnet has not been on ham
radio digital modes for at least 11 years, if ever. The coordinator
for one of the adjacent subnets went off air 7 ot 8 years ago. He is
a bit hard to reach since his phone is unlisted. You have to write him
a letter, and he might answer it ... or might not. Some folks that should
be in that subnet have given up and gotten addresses in an
adjacent subnet instead.

> You don't have an IP station until you find the coordinator.

Huh?

> Meanwhile, rather than wringing your hands on what to do, the most
> obvious thing to do (after a lengthy missing-persons report on the
> coordinator) is to just have fun.

To whom would you send that missing persons report?
Let me guess: to Brian, as I sugested in my response that caused
all the flames. Duh ...

> being just a little bit stupid in continuing to use it. A lot has
> occurred in IP networking since those long days ago.

Exactly the point. Someone would be stupid to use anything other
than a net 44 address over ham radio. Nobody could talk to them.

A related issue is the state of the assignments. There are assignments
to folks who have died, have moved into different subnets, have
changed callsigns, etc. There appears to be no mechanism to keep
the assignements anywhere near close to reality.

Yet another issue is how to percolate radio network routings into
the internet. There does not seem to be any move toward a
solution of this "interesting" problem.

Example: you cannot ping i386.w0rli.ampr.org from anywhere on
the internet, even though there are (at least) three different ways
to reach that (radio only) host from the internet over ham radio
network links. The tcp/ip community has simply not found any way
to solve this particular problem.

These are things that need to be fixed, to make tcp/ip a more
viable option for ham radio.

Only because you are "out to lunch", and can't see the future. Of
course there are "moves" going on. Most of these folks are working at
places like Motorola and Qualcomm, etc.

> Example: you cannot ping i386.w0rli.ampr.org from anywhere on

> to solve this particular problem.

Of course they could. The problem is - noboby gives a poop about
amateur radio applications, because of attitudes like yours - which
stifle the obvious Internet backbone solutions. Commercial Internet-
backboned RF networks are the future.

> These are things that need to be fixed, to make tcp/ip a more
> viable option for ham radio.

You got that right. Nobody is going to mess around with ham radio
solutions, when they can make millions of dollars doing the same thing
with commercial applications.

>a bit hard to reach since his phone is unlisted. You have to write him
>a letter, and he might answer it ... or might not. Some folks that should
>be in that subnet have given up and gotten addresses in an
>adjacent subnet instead.

Of course it is a dull job to be a coordinator. I know it, I am one of
them myself. But with a couple of small scripts it is not that bad...
Just read the person's mail, add a line to the file, and let the script
to the rest.
Still not very rewarding, as you will get all the flak when people want
things that are not foreseen in the subnet assignment plan.
(suggesting them to write a better plan usually quiets them)

What I would find bad is when a person sits on his "coordinatorship" but
is unwilling to perform the task. I don't think that is the case there.
Probably there just isn't anybody who is willing to provide this service
in your area.
When that is a nuisance, just go do it yourself.

> in the local subnet?

Stop it. The suggestion was, there were no existing IP networks, and
the user wanted to set one up. Otherwise he could have just contacted
the person he heard on the air instead of a worldwide newsgroup.

> The point, Steve, is a simple one. For some subnets, there is not
> a coordinator. If nobody tells Brian about this, there never will be
> a coordinator for that subnet. So you might as well go directly to
> Brian and get things fixed.

My only sub-point had to do with what the interested party did
during the time that all this coordination would consume.

> Huh?

Who?

> Duh ...

Really!

> Exactly the point. Someone would be stupid to use anything other
> than a net 44 address over ham radio. Nobody could talk to them.

Your suggestion that using a 44 address is going to solve all problems,
is bogus at best, if there is no current 44 network. You're assuming some
other 44 net will be reached, and the chances are, that it won't be
reached during your lifetime. This may be hard to understand in a city
that has intelligent stop-lights every quarter of a mile, but out on the
prairie, it's another story. You may *never* run into a digital ham group.

> A related issue is the state of the assignments. There are assignments
> to folks who have died, have moved into different subnets, have
> changed callsigns, etc. There appears to be no mechanism to keep
> the assignements anywhere near close to reality.

It used to be, that someone could step up and take charge and edit
the ampr list, but hackers put an end to all that. Even still, you could
ask for a password and become the editor if not the coordinator.

> Yet another issue is how to percolate radio network routings into
> the internet. There does not seem to be any move toward a
> solution of this "interesting" problem.

Go read all the poop at www.ampr.org as it has a very narrow vision
of what net 44 is and will ever be. Pretty dry, and not very interesting.
Whoever wrote that HTML doesn't drink beer in a social setting.

> Example: you cannot ping i386.w0rli.ampr.org from anywhere on
> the internet, even though there are (at least) three different ways
> to reach that (radio only) host from the internet over ham radio

Most ham routers don't know what to do with non-44 net addresses
and drop them by default (X-1J for example).

> These are things that need to be fixed, to make tcp/ip a more
> viable option for ham radio.

Yes. But not under the current top-level management. You can't
fight city hall, and sometimes it's better to find another solution.
One that is more dynamic and real-time; and, there are other
solutions.

What I am proposing, is the 44 net has outlived its usefulness,
and I can think of two ways to do the same thing.

In other words, folks who work for companies that would stand to make a
bundle of cash any time Hams lose spectrum. - Particularly in light of
"wireless Internet".

> > Example: you cannot ping i386.w0rli.ampr.org from anywhere on

> backboned RF networks are the future.

Actually that is not the future, but the "present" way that many commercial
outfits are doing things. Railroads, for example. - But none of these
commercial outfits is "Ham Radio", and Ham Radio is not a commercial outfit.
What works well for them can be a very efficient way for Hams to shoot
themselves in the foot.

Different objectives require different means of getting there.

When the no-code tech liscense was brought up, we Hams heard a lot about all
the "expertise" we would get from the telecommunications industry... What we
got instead from that industry were a bunch of narrow-minded morons who
can't see past their own noses, and who have no real interest in Amateur
RADIO. - Along with a goodly portion of characterless jerks who repeatedly
try to talk Hams into doing things which will lead directly to loss of
spectrum. I suppose they figure that if they can undermine Ham Radio and
claim credit for it, they might get a raise or a promotion.

There it is again, the typical LandLine Lid confusion between the motivations of Amateur Radio operators and the motivations of commercial outfits.

If you are not really interested in being a Ham, why not do the decent thing and turn in your license?

This is going to sound like a troll, but bear with me.

I have not really kept track of Ham Radio for quite a while now.
Starting in electronics in the 1970's, I got a lot of exposure to ham,
but never got a licence.

Since I lost track of ham, there have been at least two developments
that should hit ham radio like a bombshell, namely digital voice
compression (mpeg) and also digital video compression (mpeg again).
Voice compression should allow voice traffic to go to very narrow
channel modes, with a resulting dramatic increase on the number
of people able to get on a given band, plus the greater accuracies
and longer range receiption afforded by digital error correction.
Digital video, mpeg-1 style, should change ATV entirely, allowing
ATV work in much narrower bandwidth, and much lower frequencies.
Could it even allow DX ATV ? I don't see why mpegs cannot completely
replace slow scan.
I know some of this technology is pretty new, but is anyone doing this/
working on this ?

Thanks in advance.

>
> Come on Charles, you were a no-code Ham, what attracted you to the hobby?
> What does your posting have to do with TCP/IP??

Actually, I was never a no-code Ham, as if that really mattered one way or another. Lots of great no-code Hams out there.

I started off as a 5wpm novice, and by the time I took my tech exam, I had been hanging around the novice CW part of 40m long enough that I decided to take the 13 wpm "general" code test, just for ha-ha's. Imagine my surprise when I passed it! So it was back to the grindstone, studying for the written part of the general ticket. So it went. (Yawn)

My comment was not about no-code Hams, Einstein, it was about no-coders *associated with the telecommunications industry*, (just as I said in the original post - sorry about your lack of basic reading comprehension) that all the Ham magazines put forward at the time as being a great asset to the Ham community. - Then they turned out to be much like you, instead. What a let-down!

The GREAT majority of the worthless jerks I mentioned were and are, of course, tcpip buffs.

Everybody else knows that... I'm not surprised that YOU would like to pretend that you didn't know what I was talking about.

Watch your step, Steve; Get saucy with me again, and I'll start mentioning "your fellow Hams", and you know how uncomfortable THAT concept tends to make you feel!

These concepts were not pioneered in Amateur Radio. First off, the position measurement system (GPS) was developed by the Government. Businesses and police departments have been transmitting position information via radio for years. Before there was GPS they were doing it with Loran C. Almost 20 years ago I was working on a project where we transmitted Loran C positions back to a central dispatcher via a VHF communications system and displayed the vehicle's position on a computerized map. The only way it was related to Amateur Radio was that we happened to have a couple of hams working there.

Has anyone used the SCS PTC-II with WinAPRS?

I can get WinAPRS to read from the PTC-II, but every sentence begins with "2:fm W1xxx....." where 2: is the port in which I have the Packet board module installed in the PTC-II. WinAPRS thinks the station is 2:, not W1xxx and I can find neither a command within the PTC-II structure to suppress the port number output nor a filter file within WinAPRS to tell it to strip the first two characters received from the tnc.

Tnx, Tom K1TC

Scott,

At this point, analog signals are still taking a narrower bandwidth than a digital signal. Commercial and government FM is already heading toward a narrower band FM, half the width of our current FM emission.

When it gets to ATV, well as other arguments on this forum have been talking about, 1200 is about as fast as our digital modes go. Maybe 56k, but not anything near the 6mHz or so required by MPEG.

As some have been mentioning, our data transfer capabilities are severely limiting our move to the digital world.

Ed

I suppose that depends on you mean by "moving to the digital world"...

If your concept includes Amateurs building digital systems of any significant size or distribution that are "competitive" with networks built, controlled and developed by governmental and commercial agencies, then I have a news flash for you; Hams will NEVER be able to effectively "compete" with entities which control resources of that type, level, and depth. - It will never happen. Forget it. Get real.

Hams do not have the physical resources to do so, and do not have the intellectual resources (funding, laboratories, equipment, personnel, universities, and so on) to "play" at anything approaching that level. - And they never will. This is simple reality.

On the other hand, Hams are in an excellent position to pursue technology and infrastructure that governmental and commercial entities have no interest in, and are not pursuing, themselves.

Traditionally, Hams have provided communications in those instances where governmental and commercial communications systems have broken down or have been pre-empted, because in these cases, "competition" simply does not exist. What we then have to offer is MUCH better than the alternative, which is nothing whatsoever.

Beyond that, Ham Radio communications are strictly a "hobby", and are done on a recreational basis. Again, "competition" with non-Ham communications does not enter the picture here. For most of Ham Radio's history, non-Ham communication systems have been faster, more reliable, and more generally useful than the recreational communications between Hams. There is nothing new about this. It is simple reality and is highly unlikely to ever change, for reasons that are obvious.

This is why Hams who do not worry about "the baud rate race" and concentrate instead on building up viable medium/slow speed infrastructure are so much more successful (within the pursuit of reasonable purposes, legitimate to the hobby) than the clique who insist that only "competitive" networking is worthwhile, and so end up achieving very little if anything. Their a vision of Ham Radio is only as a minor parasite, hanging off of the Internet's butt

and completely dependent upon it in order to function at all. - And so by definition becoming useless in times of disaster or emergency.

Ham Radio digital networking does not need to be as fast as the Internet in order to be viable and functional, but it does need to be completely *independent* of the Internet.

The most crippling limitation that Hams are currently experiencing in their move into the digital world is the perception that we must somehow "compete" with governmental and commercial agencies that possess resources far beyond those available to Hams. Part of this crippling perception is the erroneous idea that we must compete in the "baud rate race".

So when you hear a Ham saying that we must use IP and "compete" in the baud rate race with the Internet, you can be sure that you are listening to the very attitude that has limited and discouraged the development of digital Amateur Radio, not one that has brought it forward or enhanced it's primary purposes; Alternate communications during times of emergency/disaster, and recreational communication among Hams so that independent infrastructure will be there when needed for that emergency use.

Charles,

I hate to say it, but you have a pathetic, defeatist attitude.

Amateur Radio has been known for years as creating and providing some of the major advances in RF technology. Amateurs have been on the forefront of most technological advances for many years. To say that we can't compete with the commercial agencies is just ridiculous. Look at APRS, many commercial entities are using the concepts that were pioneered in Amateur Radio to create position measurement systems.

And we don't have access to equipment and laboratories? Bull!!! Most laboratories are probably run by Amateur operators. Equipment? When we can't build it, we've always found ways to acquire it. If nothing else, in the surplus market.

I feel sorry of you who are staying in the analog world. Technology is passing you by. In not too many years you will find most if not all communications being conducted over digital modes. The FCC and the ARRL is already starting to work with software definable radios. Extremely complex communication protocols are already being implemented in $0.50 chips. Cell phones are costing very few dollars to manufacturer. Commercial radios are converting to digital. Nextel is putting the commercial two-way folks out of business.

As to your desire that Amateur Radio be complete segregated from the Internet.....
What a really STUPID concept. Anyone who knows how to create disaster resistant networks knows that you want as many connections as available. And it's also pretty stupid to separate ourselves from the rest of the world when it's the rest of the world that we are trying to help. Where would Amateur Radio be if we didn't do phone patches? Where would Amateur Radio be if it didn't use power from the commercial mains?

It's a pretty impressive thing to see two field day operators talking to each other during a disaster. Yep, two stations that can pass messages. But to whom? You have to interface to the rest of the world. You can't create islands.

To rely on the Internet completely is just as dumb, BUT, as you so eloquently put it, sometimes we just can't compete with the dollars of big business. And guess what, the dollars have created a really disaster resistant network that we might be able to use to assist us in doing our job. Remember that Arpanet/Internet was created as a disaster resistant network with a lot of our tax dollars. Their is more routing redundancy in the Internet then probably any other network, including the telephone

network.

4014. Money Maker !

Newsgroup: rec.radio.amateur.digital.misc

HOW TO TURN SIX DOLLARS INTO SIX THOUSAND DOLLARS: Below is a testimony, written by Terry Thornton..

I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of 6.00! So I thought, "Yeah right, this must be a scam", but like most of us, I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured: "what have I got to lose except 6 stamps and $6.00, right?" Then I invested the measly $6.00. Well GUESS WHAT!?... within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end of the second week I had made a total of over $1,000.00! In the third week I had over 10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!! Let me tell you how this works and most importantly, WHY it works... Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy! Suggestion: Read this entire message carefully! (print it out or download it.) Follow the simple directions and watch the money come in! It's easy. It's legal. And, your investment is only $6.00 (Plus postage) IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is 99% no risk - it really works! If all of the following instructions are adhered to, you will receive extraordinary dividends. PLEASE NOTE: Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list. Here are the easy steps to success:
STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen

through the envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal. Mail the 6 envelopes to the following addresses:

#1) B. Carlson 302 University ave. NE, Minneapolis MN, 55413

#2) J. Henkel 131 Cedar Grove Ave. New London CT 06320

#3) Carlos 1652 W. Gardena Blvd., Gardena,CA 90247

#4) A. Graham 302 W. 5th St.; Fulton, MO 65251

#5) G. C. Acker P.O. Box 29116, 7001 Mumford Rd. Halifax N.S. Canada B3L 4T8

#6) L.Wilson 332 N. Westridge Ave. Covina CA 91724

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the list.
STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups) All you need is 200, but remember, the more you post, the more money you make! You won't get very much unless you post like crazy. :) This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of integrity, the program will continue and the money that so many others have received will come your way. NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.) So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you're in business! ---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS---------- Step 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory. Step 2) Open a blank 'notepad' file and

place your cursor at the top of the blank page. From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list. Step 3) Save your new notepad file as a .txt file. If you want to do your postings in different settings, you'll always have this file to go back to. Step 4) Use Netscape or Internet explorer and try searching for various newsgroups (on-line forums, message boards, chat sites, discussions.) Step 5) Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button. You're done with your first one! Congratulations...THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup! **REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT : YOU HAVE TO POST A MINIMUM OF 200** That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.** Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $625.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me 3,125.00!!! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625,00! With an original investment of only $6.00! AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is: do you realize that thousands of people all over the world are
joining the internet and reading these articles everyday?, JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet. Remember, play FAIRLY and HONESTLY and this will really work !!

If you only saw doom 'n gloom in my post, then I must assume that you have allowed yourself to be hoodwinked into thinking that Hams should or could "compete" in the baud rate race.

You should be thanking me for the dose of reality. It is only when you have left your misconceptions behind that true progress becomes possible.

>working on this ?

Yeah, some people are working on it. We did digital voice here back in 1990, high fidelity at 56 kb in a 100 kHz channel. Since then there has been much progress with codecs to the point where the required data rates for toll grade speech have fallen 10 fold. That takes it out of the special RF modem range and down into the range where the digital signal can be crammed through an ordinary FM voice grade radio occupying a 15 kHz channel. But guess what, we've been putting toll quality speech through voice grade FM radios for over half a century. Nothing new here. No savings in occupied bandwidth, little or no improvement in range. Etc.

Now if the average amateur didn't insist on doing digital through his Yaekencom FM voice radio, we could build special RF modems that would occupy less bandwidth than a FM analog voice signal. We could squeeze it into as little as 600 Hz of occupied bandwidth. But don't hold your breath waiting for that to happen. It has as little chance as the widespread adoption of the 56 kb MSK RF modem we've had available since 1989. Most amateurs won't buy it if it doesn't come from Japan ready to plug and play (and the plugs better be prewired, see Rigblaster).

Now there are some real benefits to digitized voice. We can route it, for example, over a digital network to give us linked systems such as we never dreamed were possible a few years ago. We can use FEC to push it through noisy links. Etc. But the chance that it will conserve occupied bandwidth is practically nil. Amateurs will still be using voice grade FM radios to carry the digital audio signals. (Hell, people are actually running PSK31 through voice grade FM radios on VHF. That makes a 31 Hz wide signal tie up a 15 kHz channel.)

Digital TV, well understand that the HDTV signal has a data rate of
1.2 Gbit/sec. Even at microwave that's a stretch. We're using GPS
synchronized external clocking in order to try to fit it into current
40 MHz STL channel allocations to get it out to the transmitter site.
(Removing the clock signal lets us stuff the data bits more tightly.)

Compressing it with MPEG and then modulating it 8VSB can fit it
into a 6 MHz channel. That's the system broadcasters are moving
toward right now. But that on the fly MPEG conversion requires a
rack full of equipment that costs over $100,000. (Doing the reverse
conversion from MPEG back to straight video is a much easier
task, fortunately, or DTV receivers would be totally out of reach of
the average viewer.)

SDTV has one fourth the data rate, but the on the fly MPEG converter
still costs $100,000, and 8VSB still occupies 6 MHz even if we're only
using it at one fourth capacity. So there's no occupied spectrum savings
there either. We already have analog SDTV in a 6 MHz bandwidth.

If we were to rate reduce 8VSB, we could fit a SDTV signal in 1.5 MHz.
That's still too wide for any amateur band below 70 cm, and we're already
doing ATV on 70 cm. We could have more channels there it is true, but
to do it we'd have to have special equipment at both ends of the link.

Today, a cable tuner and ordinary TV can be used to receive ATV. With
this special signal, not even the new DTV receivers would be able to decode
it (because it is running at a different rate than they are designed to decode).
We'd have to build everything ourselves all the way to the CRT. Is that likely
to happen in anything like a large scale way in the amateur community?

Having observed amateurs for 35 years, I think not. If it can't be added
as a simple accessory to their analog radios, they aren't going to do it.

I'm sorry to be so down here, but this is the reality we've been facing
in digital amateur radio. Enough people won't get off the dime to let
anything better than what we've been doing for the last 20 years achieve
a critical mass unless it is a pure plug and play that they can use with
their existing Japanese analog radios.

We aren't radio amateurs anymore, we're just radio users, not much
different from CBers. Even Hank and Charles, who moan so much,
are just radio users, stuffing bits through their Japanese radios instead
of through a Taiwanese telephone modem. If they started building and
using high performance RF modems, then they might be able to say that
they're putting the radio back into radio amateur.

Smelt your own copper too Gary? Roll your own sheet metal?

Some of us have interests other than building the low level
bits and pieces of the internals of things. Been there, done that.

Thousands of Hams cooperated to build the AX25 packet network and HF
forwarding nets that the tcpip goons showed such intolerance about and
actively worked to undercut. - So your "theory" does not hold water.

You are just indulging in some of the very behavior I described...

"The constant insults and accusations directed against the general Ham
community didn't go over too well, either."

I guess that sort of behavior is so deeply ingrained that it has become a
"knee jerk" or just plain "jerk" reaction by tcpip buffs such as yourself.

Thank you for the direct verification of my opinion. It's nice to be proved
right.

Hank, you just missed my point. My point is that to provide adequate emergency communications, we have to be prepared to use all methods available to us. Even if it comes down to flying homing pigeons back and forth. but I guess that does put us at odds with one another. If a person is laying on the ground dieing, I will try to help them using any means possible. I'm assuming that you will help only if you can use a radio to do so.

No Hank, that's only the way that you think things are. Even if the Internet passes all of the messages before you can do so, isn't just exchanging the BIDS and MIDS with your other radio stations showing that the network works? And if the Internet connections go down, wouldn't the traffic automatically start being carried on the RF links?

> Understand now?

Jeesh, I'm beginning to think that you paid someome to put your name on some software, it certainly doesn't seem as if there is any logic behind your thinking anymore.

The point is that if we depend ONLY on emergency power, we couldn't get our job done. How often does your station run on emergency power? 0.001% of the year? If that much? Just because we don't primarily rely on generators, batteries, and other alternative power sources doesn't mean that we can't use them when we need to.

The analogy between power and the Internet are similar. During "normal" times we can use the cheapest, best performing network. During "emergency" times we use alternative networks. Power companies and the Internet during normal times, Generators and RF during other times. Why does this make the Internet a bad thing?

>

No Baloney, just Hank.

Yes, the Arpanet was created as a disaster resitent network with many circuit being highly protected and highly redundant. It was started back during the cold war. Thinking of the telephone network, I don't believe that there has EVER been a nationwide outage, especially in recent years. Even during disasters, there have been many areas that have had significant amounts of service. And in those areas where service wasn't available, seldom have you had to go over 50 miles to find reliable service. But even when portions of the telephone network goes down, that doesn't mean that the Internet is down. First, there are many locations that don't use dial-up connections. They use dedicated circuits which bypass a lot of telephone network. Even ADSL is split off of the cable before it hits the switch. You don't get the overloading effect that you have on the telephone. And it's usually not the failure of service during a disaster, it's an increased capacity requirement that causes most of the problems. Not anywhere near as big of an issue on the Internet circuits.

And there's a good number of businesses that use satellite of microwave to get their Internet connections. Maybe a little rain fade, maybe a dish needs realigning.

No, I'm not saying through away radio. No, I'm not saying use the Internet exclusively. What I am saying is that we should combine the networks and use the best of both.

Ummm, you might want to go back and read my original message. It was
about how mpeg and similar technologies might allow a lowered scan rate
TV to be used on lower frequencies.
I don't know what the hell you are talking about with "competing" with
commercial organizations. I don't see how staying with SSB and slow-scan
instead of using some off the shelf mpeg software or hardware is keeping
the ham hobby somehow "pure" of commercial interests. Based on that idea,
then you should be assembling your own transistors, since those are
commercial as well.

Hardly missed your point!
Please read what I write.
Perhaps even try responding to the questions.
Try to keep focused on ham radio, what it can or should do.

> use them when we need to.

Where did I write "ONLY"?

The truth is that my station tends to be run about 1% of the time on emergency
power during the usual year. Some years a bit more, some years a bit less.
Sometimes when I'm on emergency power there is no telephone service,
sometimes there is no telephone service but there is power. Depends on
exactly what fell down, blew down, or was knocked down by some pickup
going off the road. There has always been working cell service though, so I
should rely on it and forget ham radio according to your argument.

> The analogy between power and the Internet are similar. During "normal"

> times we use alternative networks. Power companies and the Internet during
> normal times, Generators and RF during other times. Why does this make the
> Internet a bad thing?

There are no longer any alternative networks.
The Land Line Lids killed them off.
They ain't there. We can't use them.

You are confusing MILNET with ARPANET. Read the history.

> Thinking of the telephone network, I don't believe that

> capacity requirement that causes most of the problems.

And so we don't need emergency communications?

> Not anywhere near as
> big of an issue on the Internet circuits.

Ok, I'm convinced!
There is no longer any need for hams to prepare
for, or take part in, emergency communications.

> And there's a good number of businesses that use satellite of microwave to

> No, I'm not saying through away radio. No, I'm not saying use the Internet
> exclusively. What I am saying is that we should combine the networks and use
> the best of both.

No disagreement at all.
But that is not what hams did.
They threw away the radio networks, and placed total reliance on the internet.

Is that a legal limit, or a technology limit ?
My understanding is that you can seek specific licences for experimental work
in the ham bands, and that such demonstrated experimental work is what leads
to new modes being put into the rules.

Well, I am not a ham, as stated before. Most of the guys I have worked with over
the years were hams because they liked to build their own equipment and
tinker.
I assume someone must be of that mindset, since someone started packet radio.

The correct statement is "tens of thousands of hams worldwide."
The growth was pretty fast in the late '85 - '88 time frame.
Peaked at roughly 55,000 hams and over 5,000 servers.
I'm sure we will hear from the anti-ham folks:
"Oh no, it never happened, blah blah ..."

There is an awful lot of "anti-ham" opinion out there.
Tends to discourage the newcomers.
Many have told me this.

No, I would not be for HDTV/HAM, or understand the point thereof. I was
thinking more about slow scan and standard TV. HDTV is about what you can
do with the present 6mhz bandwidth, which is too much for most hams, since
that has worked with broadcasters by finding the nearest high mountain,
not a very ham friendly mode.

> Compressing it with MPEG and then modulating it 8VSB can fit it

>

I disagree. Mpeg is compressable and expandable by an intel cpu. Now I know
that mpeg is simpler to expand than to compress, but 400 mhz chips can
expand quite well, and we are headed north of 1ghz.
I'll let the 100,000 thing you said stand, but no, I don't personally
beleive that either. Mpeg 1 and mpeg 2 chipsets exist, and are being
interated with handheld cameras now. I think you are talking about
studio equipment.

>

I think that the first target is slow scan or similar. Mpeg-1 technology
is considered old now, but that would be adequate for ham use. Further,
the number of frames per second and total resolution could be jiggered
downwards. My personal target would be a lowered resolution, lowered rate
signal in the bandwidth occupied by a FM voice signal. This would be well
within the compression capabilities of current CPUs running openly
avialable software.

> Having observed amateurs for 35 years, I think not. If it can't be added

I yea, I am aware there are two kinds of hams, those that do, and those
that don't. I don't think it particularly matters, since those that don't
pay a lot for their hobby, and eventually buy from the do's (like packet
radio).

I agree in general, but I don't think I would bother saying "anymore".
The same complaint existed when I first read about ham in the 1970's.
I'm betting that you could find the same thing printed about the 1960's,
1950's and 1940's.

What I think is slightly interesting is the whole patent issue. That is that with all the patents flying around, that amateur activity might establish some prior art for some of the stupider ones. Like isn't there a patent that basically covers any wireless device hooked to the internet?

Also, even the cell phone guys come up against expectations that wireless is going to be easier to do than it really is. Because my understanding is that something like WOP or the systems that talk to the wireless Palms and things aren't hugely far ahead in bandwidth of what ham radio connections are at. Radio harder than wires. Really.

I like digital modes also. But...

One problem which explains why those have had little effect on ham radio.
Ham radio has not progressed in digital data transfer since about 1985. For
the most part in the U.S. we are stuck on 1200bits/sec. Yes, 1.2kBIT/sec.
Sometimes 2.4kbit/second. A few have 9.6kbit, and a very few have 56kbit.
You have almost no choice in 9.6kbit equipment, and for 56kbit or faster you
have to build your own, or buy commercial (i.e. not ham band) wireless gear.

So that's about it... Until high data rate digital transmission becomes the
norm, there is just no bandwidth for digital voice, much less digital video.

I'd actually like to work with some higher power 2.4ghz gear (bandwidth there
does 1mbit and more), but I'm not up to building my own from scratch (kit if
no exacting alignment I could do). So I pretty much have to stick with
commercial stuff, and maybe an amp. But I have nobody within range to
experiment with, and I can't leave it running unattended, because it has to
have automatic transmit power control... Oh well, maybe someday.

Let's be honest here.

You seem to claim (in multiple postings) that this network was killed
by internet forwarding of packet radio bulletins.

I claim that the decline of the packet radio network was due to direct
internet access by licensed amateur radio operators. i.e. these
messages were never transported by amateur radio means neither locally
nor through any packet radio link chains.

Over here, it has been legal to tunnel packet radio messages using
public telecommunication networks between amateur subnets since 1997,
but the packet radio network had declined long before that. The only
form of packet radio network that is working well and there seems to
be an interest of maintaining it is the DX-cluster network. The
maintainers are often keen HF-DXers, who have a keen personal interest
of maintaining the network.

That may very well be true. In de early days of the packet radio BBS
network, this network was the first way for many radio amateurs to
transport e-mail to their friends all over the world, read news bulletins,
etc.

Ok, there was the Fidonet network, but access was usually difficult
(telephone lines BUSY all the time), and there were variable costs like
telephone charges and message charges by the sysop.

But with the advent of private-user Internet access, any guy in the street
can send and receive e-mail and access information, so why would you do it
via packet radio and be able to reach only a small number of users and
access only limited amounts of information?

This hasn't only killed the packet network, but the Fido network as well!
(in the same way: some people desperately try to keep smaller and smaller
parts of it alive, fighting against the Internet using the same arguments
as HAMs use to keep the packet network alive)

It is like the 2M Handheld. In its early days (the Icom IC-2), every
amateur wanted a handheld and they used it to chat on the local repeater,
communicate with friends while visiting rallys, and sometimes even carry it
on the street and be able to chat with someone while shopping.
Everyone else would see those guys as geeks. But now, everyone has a GSM
phone and is doing exactly the same things.
But who is still using his 2M handheld? Mine has been in the closet for
years, with defective NiCd batteries.

Apparently there are trends, sometimes radio amateurs are early adopters, and after a while these things die off again. Another trend appears, interest peaks, and the same thing happens.
Right now, many of the still active radio amateurs are in FM ATV. This has some of the characteristics of many trends in amateur radio: surplus equipment is available that makes part of the job easier (phased-out satellite TV indoor units that became worthless when sats went digital), and interesting parts came on the market that made constructing a UHF/SHF transmitter easier for the average amateur.
But of course, the surplus unit supply will dry up, the parts will disappear (because integration advances, and the customized parts that replace them are no longer usable by amateurs - has happened many times!). Also, the bands quickly get filled by these wideband signals, and we may lose some of these bands in the near future.

So, this will probably be temporary as well, just like packet radio. Besides, with all these trends a factor is that it gets boring after some time. When the initial thrill is over, only the really dedicated operators remain on the mode. The rest moves on.

I forget the mans name, but he developed a packet radio digital voice
application back in the late 80's. It was kind of neat. Many old timers
will recall a program for the PC that played voice over the speaker and
sang "Daisy." This was a 1 bit software A/D and with compression
was easily transported by even 1200 baud. I used the same software
idea (PC 8 kHz software interrupt), only I sampled an 8 bit A/D. I wasn't
very good with Op-Amps back then, and bought a Covox card that
had an 8 bit A/D with a very nice audio section.

I found that once you had audio in a sampled digital form, that you
could do many things with it. First of which, is block it up into 20 ms
segments, and second to wrap it with other digital information.

> That takes it out of the special RF modem range and down into the

> FM voice grade radio occupying a 15 kHz channel. But guess what,
> we've been putting toll quality speech through voice grade FM
> radios for over half a century. Nothing new here.

I don't think getting digital voice below 5 kHz is the issue. In my
opinion, getting digital voice down to 5 kHz that sounds good is
the issue.

Bandwidth right now is chopped up in frequency domain slices,
and legal entities must be incorporated to assign these channels
(as we call them). We also have the time domain to consider. If
we could get digital audio that fits in a 5 kHz bandwidth (and we
can now) then other coding schemes can be used.

Take a simple TDMA coding scheme. With TDMA you could
easily have 4 channels of voice (or voice and data) in one 5 kHz
channel quite easily, and there is aslo CDMA.

Both of these take the same "channel" and use it for four things.
Therefore we have 5 kHz divided by four in a digital setting, and
5 kHz divided by one in an analog setting.

> Now if the average amateur didn't insist on doing digital through his
> Yaekencom FM voice radio, we could build special RF modems that

Wouldn't increasing the channel occupancy do the same thing?

> We could squeeze it into as little as 600 Hz of occupied bandwidth.
> But don't hold your breath waiting for that to happen.

Then you're offering the group here a solution that even you don't
believe will ever happen. How valuable is that?

> It has as little chance as the widespread adoption of the 56 kb MSK
> RF modem we've had available since 1989. Most amateurs won't buy
> it if it doesn't come from Japan ready to plug and play (and the plugs

Everything gets down to personalities. If the 56 k modem was any
good, then it would have been marketed. Failure in marketing kills
more businesses than financial mismanagement. You can fix the
later, but once you miss your target on the first, you are ready to
stick a fork in it (dead meat). If you could have got a real distributor
to put it out, instead of a mom and pop operation, then the modem
might have made some real money. Wide band modems is not where
terrestrial communications are headed. The P3 satellite might
support that waste of bandwidth, but it has a time domain as well
(called an orbit).

> Amateurs will still be using voice grade FM radios to carry the
> digital audio signals.

However, it is multiplexed with other digital signals (callsign, smart
squelch, etc).

> Having observed amateurs for 35 years, I think not. If it can't be added
> as a simple accessory to their analog radios, they aren't going to do it.

The issue isn't if three people do it, it is if two people will. That's how
any new mode gets started. If it is fun, then two will increase at an
exponential rate, and then at some future date, as people get bored,
a linear brick wall type of free-fall occurs as everyone sells thier junk
at a swap meet in Dayton...

> I'm sorry to be so down here, but this is the reality we've been facing

> their existing Japanese analog radios.

You keep blaming the Japanese, but I haven't seen any 4 color ad's out
of PacComm, so I don't expect wideband modems to begin selling like

hot-cakes, especially since they don't have little buttons that go beep,
or video displays that have your callsign in them...

Marketing...

> We aren't radio amateurs anymore, we're just radio users, not much
> different from CBers.

I take offense to this. Just because you are bored and no one is joining
your club, is no indication that other Amateurs are not having fun.
I see excellent projects out there, and if you don't then I can only
suggest that you have the wrong friends, or club.

I think this is an exciting time in Ham radio, and that everything we've
(not me, the hobby) done in the past, will be valuable to the next
popular mode.

Darn it Steve, will you please *stop* this!
I agree with everything you said.

In particular, it is also my opinion that the biggest failure has been
the failure to market the more interesting products well, and the
failure to adapt them to what the "mass market" wants.

See some comments below.
Maybe someone from PACCOM is listening.

Total nonesense. Nobody cares whether it comes from Japan, or
Burundi, or Florida! It *does* need to be available in some "plug
it into things, it works" form though. Hams need to be made aware
of the product, and made aware of the reasons they might want it.
i.e. full page color ads in the major ham magazines, articles written
to build the hype, etc. etc. This is the *only* way to drive down
the cost.

That's what happened with 1200 baud / 300 baud packet. It was new.
It was hot. Everyone wanted to play. There was a type of application
new to ham radio (yes, I know about RTTY mail drops).

> > I'm sorry to be so down here, but this is the reality we've been facing

Which can drive interest and acceptance, which can then drive the
cost reduction required. Remember that the TNC1 cost $350 ...
and it was a kit. TNCs are no longer percieved as "neat new hot
stuff", but simply as "another possibly useful station accesory".
How to make it "neat new hot stuff"? Probably tcp/ip potential, but
that too must be marketed.

> > We aren't radio amateurs anymore, we're just radio users, not much

An interesting point that is not often discussed: what was the actual
technical innovation of packet radio? It wasn't the modem, there were
plenty of 1200 baud (and much faster) modem technology at the time.
It wasn't the ability to send text over ham radio; RTTY had been around
for a long time. It wasn't the ability to send programs over ham radio,
that had been done for years, using RTTY (e.g. WB6UUT). The only
thing new and different was the ability to network computers together.

The innovation was the actual building of those networks. At first simple
store and forward and trivial gateway capability. Later the potential
to use internet protocols. It was all about cooperation in a large scale
project involving thousands of hams. Once that project was complete,
many hams moved on to other facits of the hobby. None of this was
any big surprise to those of us who kicked it all off. It's how fads usually
work: a few start them off, a lot of people pick them up, and then
they die out.

The puzzle is how to do this again, now that fast networking is possible.

They didn't have a sale this Friday on Samuel Adams, so I
had to get the Miller Light (I think the 3.2 mark must be wrong).

> In particular, it is also my opinion that the biggest failure has been

I look at some of the players in packet by monitoring their web
pages. While I like simple HTML, the manufacturers of Ham
Equipment are extremely weak in their presentation. Some of
them haven't changed in years. One of them (who I shouldn't
name) doesn't even answer email from the link given.

It's almost like they are making too much money as it is, but
I suspect that they can just barely meet demand, and advertising
would only run up manufacturing costs to get to the next
level. I'm only guessing...

Another repeater controller startup is completely absent in
email. If you don't want email, tell the customer! Don't make
them wait a week and decide to call. Tell them to call--you don't
do email! Sheesh.

Steve

4037. NTSB and SUV

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-24 00:00:00 UTC
From: "Steve Sampson (K5OKC)" <ssampson@nospam.radio-link.net>
Message-ID: <sst6ev7kdfqr1f@corp.supernews.com>
Source record: 10779

The NTSB has released its SUV data last week.

Early in the year they had SUV manufacturers secretly install Cockpit Voice Recorder (CVR) chip in all vehicles coming into the American market.

The graphs clearly show that in 47 States the last words on the CVR chip was "Oh Shit!" In three States (Oklahoma, Arkansas, and Texas) the last words were "Hold my beer, and watch this!"

They didn't say where the chip was located.

Message:

READING THIS COULD CHANGE YOUR LIFE! I found this=20
on a=20
bulletin board and decided to try it. A little while back, I was =
browsing=20
through newsgroups, just like you are now, and came across an article=20
similar to this that said you could make thousands of dollars within=20
weeks with only an initial investment of $6.00! So I thought, "Yeah=20
right, this must be a scam", but like most of us, I was curious, so I =
kept=20
reading. Anyway, it said that you send $1.00 to each of the 6 names=20
and address stated in the article. You then place your own name and=20
address in the bottom of the list at #6, and post the article in at =
least=20
200 newsgroups. (There are thousands) No catch, that was it. So after=20
thinking it over, and talking to a few people first, I thought about =
trying=20
it. I figured: "what have I got to lose except 6 stamps and $6.00, =
right?"=20
Then I invested the measly $6.00. Well GUESS WHAT!!...within 7=20
days, I started getting money in the mail! I was shocked! I figured it=20
would end soon, but the money just kept coming in. In my first week, I=20
made about $25.00. By the end of the second week I had made a total=20
of over $1,000.00! In the third week I had over $10,000.00 and it's =
still
growing. This is now my fourth week and I have made a total of just=20
over $42,000.00 and it still coming in rapidly. It's certainly worth=20
$6.00, & 6 stamps, I have spent more than that on the lottery!! Let me=20
tell you how=20
this works and most importantly, why it works....Also, make sure you=20
print a copy of this article NOW, so you can get the information off of=20
it as you need it. I promise you that if you follow the directions =
exactly,=20
```

that you will start making more money than you thought possible by=20
doing something so easy! Suggestion: Read this entire message=20
carefully! (print it out or download it.) Follow the simple directions =
and=20
watch the money come in! It's easy. It's legal. And, your investment is=20
only $6.00 (Plus postage) IMPORTANT:=20
This is not a rip-off; it is not indecent; it is not illegal; and it is =
virtually=20
no risk - it really works!!!! If all of the following instructions are=20
adhered to, you will
receive extraordinary dividends. PLEASE NOTE: Please follow these
directions EXACTLY, and $50,000 or more can be yours in 20 to 60=20
days. This program remains successful because of the honesty and=20
integrity of the participants. Please continue its success by carefully=20
adhering to the instructions. You will now become part of the Mail=20
Order business. In this business your product is not solid and tangible, =

it's a service. You=20
are in the business of developing Mailing Lists. Many large=20
corporations are happy to pay big bucks for quality lists. However,=20
the money made from the
mailing lists is secondary to the income which is made from people=20
like you and me asking to be included in that list. Here are the 4 easy=20
steps to success: STEP 1: Get 6 separate pieces of paper and write the=20
following on each piece of paper "PLEASE PUT ME ON YOUR=20
MAILING LIST." Now get 6 US $1.00 bills and place ONE inside=20
EACH of the 6 pieces of paper so the bill will not be seen through the=20
envelope (to prevent thievery). Next, place one paper in each of the 6=20
envelopes and seal them. You should now have 6 sealed envelopes,=20
each with a piece of paper stating the above phrase, your name and=20
address, and a $1.00 bill. What you are doing is creating a service.=20
THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate=20
service and you are paying for it! Like most of us I was a little=20
skeptical and a little worried about the legal aspects of it all. So I=20
checked it out with the U.S. Post Office (1-800-725-2161) and they=20
confirmed that it is indeed legal! Mail the 6 envelopes to the following =

addresses:

#1) Samantha Blizniak, 7937 S. Newcastle, Burbank, IL 60459

#2)Katie Wiess, 14 White Tail Lane, Wallingford, CT 06492

#3)Traci Wood, 4224 Carnwath Rd., Tallahassee, FL 32303

#4)Milissa Crook, 3730 South 255th Place, Kent, WA 98032

#5)James Buckner, 11903 Coit RD. #1803 Dallas, TX 75251

#6)Bobbi Mullins, 31 Sunnydale Lane, Napoleon, OH 43545

STEP 2: Now take the #1 name off the list that you see above, move=20
the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR=20

Name as number 6 on the list. STEP 3: Change anything you need to,=20
but try to keep this article as close to original as possible. Now, post =

your amended article to at least 200 newsgroups. (I think there are=20
close to 24,000 groups) All you need is 200, but remember, the more=20
you post, the more money you make! This is perfectly legal! If you=20
have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal=20
lottery laws. Keep a copy of these steps for yourself and, whenever=20
you need money, you can use it again, and again. PLEASE
REMEMBER that this program remains successful because of the=20
honesty & integrity of the participants & by their carefully adhering to =

the directions. Look at it this way. If you are of integrity, the =
program=20
will continue and the money that so many others have received will=20
come your way. NOTE: You may want to retain every name and=20
address sent to you, either on a computer or hard copy and keep the=20
notes people send you. This VERIFIES that you are truly providing a=20
service. (Also, it might be a good idea to wrap the $1 bill in dark =
paper=20
to reduce the risk of mail theft.) So, as each post is downloaded and =
the=20
directions carefully followed, six members will be reimbursed for their=20
participation as a List Developer with one dollar each. Your name will=20
move up the list geometrically so that when your name reaches the #1=20
position you will be receiving thousands of dollars in CASH!!! What an=20
opportunity for only $6.00 ($1.00 for each of the first six=20
people listed above) Send it now, add your own name to the list and=20
you're in business!=20
---DIRECTIONS -----=20
FOR HOW TO POST TO NEWSGROUPS----------=20
Step 1) You do not need to re-type this entire letter to do your own=20
posting. Simply put your cursor at the beginning of this letter and drag =

your cursor to the bottom of this document, and select 'copy' from the=20
edit menu. This will copy the entire letter into the computer's memory.
Step 2) Open a blank 'notepad' file and place your cursor at the top of=20
the blank page. From the 'edit' menu select 'paste'. This will paste a=20
copy of the letter into notepad so that you can add your name to the
list.=20
Step 3) Save your new notepad file as a .txt file. If you want to do =
your=20
postings in different settings, you'll always have this file to go back =
to.=20
Step 4) Use Netscape or Internet explorer and try searching for various=20
newsgroups (on-line forums, message boards, chat sites, discussions.)
Step 5) Visit these message boards and post this article as a new=20
message by highlighting the text of this letter and selecting paste from =

the edit menu. Fill in the Subject, this will be the header that =
everyone=20

sees as they scroll through the list of postings in a particular group,
click the post message button. You're done with your first one!
Congratulations...THAT'S IT! All you have to do is jump to different=20
newsgroups and post away, after you get the hang of it, it will take=20
about 30 seconds for each newsgroup! **REMEMBER, THE MORE=20
NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL=20
MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200** That's=20
it! You will begin receiving money from around the world within days!=20
You may eventually want to rent a P.O.Box due to the large amount of=20
mail you will receive. If you wish to stay anonymous, you can invent a=20
name to use, as long as the postman will deliver it. **JUST MAKE
SURE ALL THE ADDRESSES ARE=20
CORRECT.** Now the WHY part: Out of 200 postings, say I receive=20
only 5 replies (a very low example). So then I made $5.00 with my
name at #6 on the letter. Now, each of the 5 persons who just sent me=20
$1.00 make the MINIMUM 200 postings, each with my name at #5=20
and only 5 persons respond to each of the original 5, that is another=20
$25.00 for me, now those 25 each make 200 MINIMUM posts with=20
my name at #4 and only 5 replies each, I will bring in an additional=20
$125.00! Now, those 125 persons turn around and post the MINIMUM=20
200 with my name at #3 and only receive 5 replies each, I will make an=20
additional $626.00! OK, now here is the fun part, each of those 625=20
persons post a MINIMUM 200 letters with my name at #2 and they=20
each only receive 5 replies, that just made me $3,125.00!!!=20
Those 3,125 persons will all deliver this message to 200 newsgroups
with my name at #1 and if still 5 persons per 200 newsgroups react I=20
will receive $15,625,00! With an original investment of only $6.00!=20
AMAZING! When your name is no longer on the list, you just take the=20
latest posting in the newsgroups, and send out another $6.00 to names=20
on the list, putting your name at number 6 again. And start posting=20
again. The thing to remember is: do you realize that thousands of=20
people all over the world are joining the internet and reading these
articles everyday?, JUST LIKE YOU are now!! So, can you afford
$6.00 and see if it really works?? I think so... People have said, "what
if the plan is played out and no one sends you the money? So what!
What are the chances of that happening when there are tons of new
honest users and new honest people who are joining the internet and
newsgroups everyday and are willing to give it a try? Estimates are at=20
20,000 to 50,000 new users, every day, with thousands of those
joining the actual internet.Remember, play FAIRLY and HONESTLY
and this will really work

of dollars=20
within
weeks with only an initial =
investment=20
of $6.00! So I thought, "Yeah
right, this=20
must be a scam", but like most of us, I was curious, so I kept =

reading. Anyway, it said that you send $1.00 to =
each of the 6=20
names
and address stated in the =
article. You=20
then place your own name and
address in the=20
bottom of the list at #6, and post the article in at least =

200 newsgroups. (There are thousands) No catch, =
that was it.=20
So after
thinking it over, and =
talking to a=20
few people first, I thought about trying
it.=20
I figured: "what have I got to lose except 6 stamps and $6.00, right?"=20

Then I invested the measly $6.00. =
Well GUESS=20
WHAT!!...within 7
days, I started =
getting=20
money in the mail! I was shocked! I figured it
would end soon, but the money just kept coming in. In my first =
week, I=20

made about $25.00. By the end of =
the second=20
week I had made a total
of over =
$1,000.00! In=20
the third week I had over $10,000.00 and it's still
growing. This is now my fourth week and I have made a total of =
just=20

over $42,000.00 and it still =
coming in=20
rapidly. It's certainly worth
$6.00, & 6=20
stamps, I have spent more than that on the lottery!! Let me =

tell you how
this works and=20
most importantly, why it works....Also, make sure you
print a copy of this article NOW, so you can get =
the=20
information off of
it as you need =
it. I=20
promise you that if you follow the directions exactly,
that you will start making more money than you =
thought=20
possible by
doing something so =
easy!=20
Suggestion: Read this entire message
carefully! (print it out or download it.) Follow the simple =
directions=20
and
watch the money come in! It's =
easy. It's=20
legal. And, your investment is
only $6.00=20
(Plus postage) IMPORTANT:
This is =
not a=20
rip-off; it is not indecent; it is not illegal; and it is virtually=20

no risk - it really works!!!! If =
all of the=20
following instructions are
adhered to, you=20
will
receive extraordinary =
dividends. PLEASE=20
NOTE: Please follow these
directions EXACTLY,=20
and $50,000 or more can be yours in 20 to 60

days. This program remains successful because of the honesty =
and=20

integrity of the participants. =
Please=20
continue its success by carefully
adhering to=20
the instructions. You will now become part of the Mail
Order business. In this business your product is =
not solid and=20
tangible,
it's a service. You=20

are in the business of developing =
Mailing=20
Lists. Many large
corporations =
are happy to=20
pay big bucks for quality lists. However,
the=20
money made from the
mailing lists =
is secondary=20
to the income which is made from people
like=20
you and me asking to be included in that list. Here are the 4 easy=20

steps to success: STEP 1: Get 6 =
separate=20
pieces of paper and write the
following on=20
each piece of paper "PLEASE PUT ME ON YOUR
MAILING LIST." Now get 6 US $1.00 bills and place ONE inside=20

EACH of the 6 pieces of paper so =
the bill=20
will not be seen through the
envelope (to=20
prevent thievery). Next, place one paper in each of the 6 =

envelopes and seal them. You should now have 6 =
sealed=20
envelopes,
each with a piece of =
paper stating=20
the above phrase, your name and
address, and=20
a $1.00 bill. What you are doing is creating a service.
THIS IS ABSOLUTELY LEGAL! You are requesting a =
legitimate=20

service and you are paying for =
it! Like most=20
of us I was a little
skeptical =
and a little=20
worried about the legal aspects of it all. So I
checked it out with the U.S. Post Office (1-800-725-2161) and =
they=20

confirmed that it is indeed =
legal! Mail the 6=20
envelopes to the following
addresses:

#1) =
Samantha Blizniak,=20
7937 S. Newcastle, Burbank, IL 60459

#2)Katie Wiess, 14 White Tail Lane, Wallingford, CT=20
06492

#3)Traci Wood, 4224 =
Carnwath Rd.,=20
Tallahassee, FL 32303

#4)Milissa Crook, 3730 South 255th =
Place, Kent,=20
WA 98032

#5)James Buckner, =
11903 Coit RD.=20
#1803 Dallas, TX 75251

#6)Bobbi Mullins, 31 Sunnydale Lane, Napoleon, OH =
43545

STEP 2: Now take the #1 name off the list that you =
see above,=20
move
the other names up (6 =
becomes 5, 5=20
becomes 4, etc...) and add YOUR
Name as=20
number 6 on the list. STEP 3: Change anything you need to, =

but try to keep this article as close to original =
as possible.=20
Now, post
your amended article to =
at least=20
200 newsgroups. (I think there are
close to=20
24,000 groups) All you need is 200, but remember, the more =

you post, the more money you make! This is =
perfectly legal! If=20
you
have any doubts, refer to =
Title 18 Sec.=20
1302 & 1341 of the Postal
lottery laws.=20
Keep a copy of these steps for yourself and, whenever
you need money, you can use it again, and again.=20
PLEASE
REMEMBER that this program =
remains=20
successful because of the
honesty =
&=20
integrity of the participants & by their carefully adhering to=20

the directions. Look at it this =
way. If you=20
are of integrity, the program
will continue=20
and the money that so many others have received will
come your way. NOTE: You may want to retain every name and=20

address sent to you, either on a =
computer or=20
hard copy and keep the
notes =
people send you.=20
This VERIFIES that you are truly providing a
service. (Also, it might be a good idea to wrap the $1 bill in =
dark paper=20

to reduce the risk of mail =
theft.) So, as=20
each post is downloaded and the
directions=20
carefully followed, six members will be reimbursed for their =

participation as a List Developer with one dollar =
each. Your=20
name will
move up the list =
geometrically so=20
that when your name reaches the #1
position=20
you will be receiving thousands of dollars in CASH!!! What an =

opportunity for only $6.00 ($1.00 for each of the =
first six=20

people listed above) Send it now, =
add your=20

own name to the list and
you're =
in business!=20

---DIRECTIONS ----- =

FOR HOW TO POST TO NEWSGROUPS---------- =

Step 1) You do not need to re-type this entire =
letter to do=20
your own
posting. Simply put your =
cursor at=20
the beginning of this letter and drag
your=20
cursor to the bottom of this document, and select 'copy' from the=20

edit menu. This will copy the =
entire letter=20
into the computer's memory.
Step =
2) Open a=20
blank 'notepad' file and place your cursor at the top of =

the blank page. From the 'edit' menu select =
'paste'. This will=20
paste a
copy of the letter into =
notepad so=20
that you can add your name to the
list.=20

Step 3) Save your new notepad =
file as a .txt=20
file. If you want to do your
postings in=20
different settings, you'll always have this file to go back to. =

Step 4) Use Netscape or Internet explorer and try =
searching=20
for various
newsgroups (on-line =
forums,=20
message boards, chat sites, discussions.)
Step=20
5) Visit these message boards and post this article as a new =

message by highlighting the text of this letter =
and selecting=20
paste from
the edit menu. Fill in =
the=20
Subject, this will be the header that everyone

sees as they scroll through the list of postings in a =
particular=20
group,
click the post message =
button. You're=20
done with your first one!
Congratulations...THAT'S IT! All you have to do is jump to =
different=20

newsgroups and post away, after =
you get the=20
hang of it, it will take
about 30 =
seconds for=20
each newsgroup! **REMEMBER, THE MORE
NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL =

MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200** =
That's=20

it! You will begin receiving =
money from=20
around the world within days!
You =
may=20
eventually want to rent a P.O.Box due to the large amount of =

mail you will receive. If you wish to stay =
anonymous, you can=20
invent a
name to use, as long as =
the postman=20
will deliver it. **JUST MAKE
SURE =
ALL THE=20
ADDRESSES ARE
CORRECT.** Now the =
WHY part:=20
Out of 200 postings, say I receive
only 5=20
replies (a very low example). So then I made $5.00 with =
my
name at #6 on the letter. Now, each of the 5 =
persons who just=20
sent me
$1.00 make the MINIMUM =
200 postings,=20
each with my name at #5
and only =
5 persons=20
respond to each of the original 5, that is another

$25.00 for me, now those 25 each make 200 MINIMUM posts with=20

my name at #4 and only 5 replies =
each, I will=20
bring in an additional
$125.00! =
Now, those=20
125 persons turn around and post the MINIMUM
200 with my name at #3 and only receive 5 replies each, I will =
make an=20

additional $626.00! OK, now here =
is the fun=20
part, each of those 625
persons =
post a=20
MINIMUM 200 letters with my name at #2 and they
each only receive 5 replies, that just made me $3,125.00!!!=20

Those 3,125 persons will all =
deliver this=20
message to 200 newsgroups
with my =
name at #1=20
and if still 5 persons per 200 newsgroups react I
will receive $15,625,00! With an original investment of only =
$6.00!=20

AMAZING! When your name is no =
longer on the=20
list, you just take the
latest =
posting in the=20
newsgroups, and send out another $6.00 to names
on the list, putting your name at number 6 again. And start =
posting=20

again. The thing to remember is: =
do you=20
realize that thousands of
people =
all over the=20
world are joining the internet and reading these
articles everyday?, JUST LIKE YOU are now!! So, can you=20
afford
$6.00 and see if it really =
works?? I=20
think so... People have said, "what
if the=20
plan is played out and no one sends you the money? So =
what!
What are the chances of that happening when there =

```
are tons of=20
new
honest users and new honest =
people who are=20
joining the internet and
newsgroups everyday=20
and are willing to give it a try? Estimates are at
20,000 to 50,000 new users, every day, with thousands of=20
those
joining the actual =
internet.Remember,=20
play FAIRLY and HONESTLY
and this =
will really=20
work

------=_NextPart_000_0005_01C02599.3243C4E0--
```

If I have a packet transceiver operating at my home qth receiving and transmitting APRS information am I then allowed to leave that device operating unattended and activate and operate a mobile APRS rig away from my house. I know I can operate more than one rig when I am present but am curious about the legality of operating from my car while my base station continues to archive APRS info.

Any help would be appreciated.

It seems like a moot point to me... You already know your home qth's
location, which is highly unlikely to change. What point is there in
transmitting APRS data on a known, fixed location?

Maybe there's a real need there, that I'm having trouble seeing. If there
is, don't worry about it. Lots of unattended VHF/UHF Packet stations
transmit, and I've never heard of anyone getting into a crack over it.

Source record: 10784

A good readable version of the rules is at:

http://www.arrl.org/field/regulations/news/part97/

97.221: (b) A station may be automatically controlled
while transmitting a RTTY or data emission on the 6 m
or shorter wavelength bands, and on the
28.120-28.189 MHz, 24.925-24.930 MHz, 21.090-21.100 MHz,
18.105-18.110 MHz, 14.0950-14.0995 MHz,
14.1005-14.112 MHz, 10.140-10.150 MHz, 7.100-7.105 MHz,
or 3.620-3.635 MHz segments.

Charles, APRS stations not only transmit their position, but
also digipeat positions and messages of others. It only took
me a second to look up the rule. Amateurs should not guess
about something which will cause them to be fined or evicted
from the bands, therefore your reply seems to advise him to
do whatever he wants, as no one you know was "getting into
a crack over it" which I assume to be some reference to the
human posterior. If you don't know, guessing is a bad habit.

4045. UHF APRS frequency?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-25 00:00:00 UTC
From: fred.mahone@vt.edu
Message-ID: <39cf8242.16418120@news.vt.edu>
Source record: 10785

I have not been following the APRS talk close enough to know if there has been any discussion about a dedicated 70cm. APRS frequency.

In southwest Virginia there is very little APRS activity. I am not really sure why this is, people have to actually build something and they do not have the ability anymore?

I would like to build some trackers, but to dedicate a two meter synthesized mobile or handheld is not economical. The kits to build transmitters and receivers end up being just as costly.

Tekk dropped its vhf mini-transceivers but still make the uhf. These units are just what I would like to use, but without a dedicated 70cm frequency, I might interfere with someone else.

I looked at TAPR's site and there was mention of a frequency, but I have not heard anything else about it.

So, can anyone shed some light on this?

Thanks,
Fred Mahone
KE4RBT

There have been a few discussions on TAPR's aprssig mailing list, but
no conclusions. You should probably check to see if your area has a
bandplan which addresses this. The bandplans differ quite a bit
between areas and it will take a lot of coordination to establish a
common frequency (as it did to get the 144.39 APRS frequency set up).
In the absence of anything in the bandplan, check out simplex
frequencies in your area. You'll probably find several that are not
being used. The local frequency coordinator (listed in the ARRL
repeater directory) should be able to help.

Is this how LandLine Lids such as yourself decide it's "OK" to transmit
commercial content (and porno, etc) from the Internet over the Ham bands?

Just curious. ;-)

In Southern California, the SCDCC has considered such a question, but decided not to suggest an allocation for 70cm APRS until the 2m APRS users state that the frequency is too crowded to be usable. I have seen some times where my TNC's rx light stays on for 5-10 seconds at a time because of APRS packets crammed next to each other.

Unlike other modes, APRS is designed to use a single frequency REGARDLESS of the number of stations. Moving its digipeater backbone to another frequency also defeats its purpose. I'm not saying that it's not possible. However, there is a reason why APRS is on the same frequency nationwide......

I found out the name - of the AEA software, that has been discontinued for a few years (according to the support people at Timewave) . It's called ACARS 900 - this alllows the PK 900 to monitor ACARS....

Anyone have a copy of this they aren't using??

Attention!! This is not a scam, this is the real deal--this is money in =
your pocket!
Note: I made the $6 leap of faith and it is paying off big time! You =
should too.
Just read what is below and see for yourself. This will change your =
life:

$6 Investment to make $1000s

: Make A Lot Of Money Fast !!!!!

:=20
: A while back, I was browsing newsgroups, just like you, I came across =
an article similar to this that said you could make thousands of CASH =
within weeks with only an initial investment of $6.00 plus stamps! So I =
thought, "Yeah, right, this must be a scam!" But like most of us I was =
curious and kept reading. It said that if you send $1.00 to each of the =
6 names and addresses listed in the article, you could make thousands in =
a very short period of time. You then place your own name and address at =
the bottom of the list at #6, and post the article to at least 300 =
newsgroups. (There are about 32,000 of them out there and that's quite a =
large market pool). No catch, that was it. Even though the investment =
was a measly $6, I had three questions that needed to be answered before =
I could get involved in this sort of thing.=20

: 1. IS THIS REALLY LEGAL? I called a lawyer first. The lawyer was a =
little sceptical that I would actually make any CASH but he said it WAS =
LEGAL if I wanted to try it. I told him it sounded a lot like a chain =
letter but the details of the system (SEE BELOW) actually made it a =
legitimate legal business.=20

: 2. IS OK WITH THE POST OFFICE OR IS IT MAIL FRAUD? I called them: =
1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL! (See 18, h =
sections1302 NS 1341 of Postal Lottery Laws). This clarifies the program =
of collecting names and addresses for a mailing list.=20

: 3. IS IT RIGHT? Well, everyone who sends me a buck has a good chance =
of getting A LOT of CASH ... a much better chance than buying a lottery =
```

ticket!!! So, having these questions answered, I invested EXACTLY $7.92 =
... six $1.00 bills and six 32 cent postage stamps ... and boy am I glad =
I did!!! Within 7 days, I started getting CASH in the mail! I was =
shocked! I figured it would end soon and didn't give it another thought. =
But the CASH continued coming in. In my first week I made between $20 to =
$30. By the end of the second week I had a made a total of $1,000.00. In =
the third week I had over $10,000.00 and it was still growing. This is =
now my fourth week and I have made a total of just over $42,000 and it's =
still coming in...=20

: It's certainly worth $6.00 and 6 stamps !!! Also, make sure you print =
a copy of this article NOW, so you can get the information off of it as =
you need it. I promise you that if you follow the directions exactly, =
that you will start making more CASH than you thought possible by doing =
something so easy! Suggestion: Read this entire message carefully! =
(print it out or download it.) Follow the simple directions and watch =
the CASH come in! It's easy. It's legal. And, your investment is only =
$6.00 (Plus postage) IMPORTANT: This is not a rip-off; it is not =
indecent; it is not illegal; and it is virtually no risk - it really =
works!!!! If all of the following instructions are adhered to, you will =
receive extraordinary dividends.=20

: PLEASE NOTE: Please follow these directions EXACTLY, and $50,000 or =
more can be yours in 20 to 60 days. This program remains successful =
because of the honesty and integrity of the participants. Please =
continue its success by carefully adhering to the instructions. You will =
now become part of the Mail Order business. In this business your =
product is not solid and tangible, it's a service. You are in the =
business of developing Mailing Lists. Many large corporations are happy =
to pay big bucks for quality lists. However, the CASH made from the =
mailing lists is secondary to the income which is made from people like =
you and me asking to be included in that list.=20

: Here are the 4 easy steps to success:=20

: STEP 1: Get 6 separate pieces of paper and write the following on each =
piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 =
bills and place ONE inside EACH of the 6 pieces of paper so the bill =
will not be seen through the envelope (to prevent thievery). Place one =
paper in each of the 6 envelopes and seal them. You should now have 6 =
sealed envelopes, each with a piece of paper stating the above phrase, =
your name and address, and a $1.00 bill. What you are doing is creating =
a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate =
service and you are paying for it! Like most of us I was a little =
skeptical and a little worried about the legal aspects of it all. So I =
checked it out with the U.S. Post Office (1-800-725-2161) and they =
confirmed that it is indeed legal! Mail the 6 envelopes to the following =
addresses:=20

:=20
:=20

: #1) Aditya Venkataraman 14215 Lake Trail Driv Sugar Land, Texas 77478=20

: #2) Charlie Baltimore 71-20 Sutton Place #3 Fresh Meadows, NY 11365=20

: #3) Shaun Littman 3061 Clubhouse Road Merrick, N.Y. 11566=20

: #4) Joseph Morris P.O. Box 37 Union Grove, Al 35175=20

: #5) M. Dixon P.O. Box 767412 Roswell, GA 30076

: #6) Lee Higginbotham 8505 Columbus Ave. #209 North Hills, CA 91343
:=20
: STEP 2: Now take the #1 name off the list that you see above, move the =
other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as =
number 6 on the list. DO NOT JUST COPY OVER THE LAST NAME, BUT REMEMBER =
TO MOVE EACH NAME UP ONE LINE!!!!!!!!=20

: STEP 3: Change anything you need to, but try to keep this article as =
close to original as possible. Now, post your amended article to at =
least 300 newsgroups. (I think there are close to 32,000 groups) All you =
need is 300, but remember, the more you post, the more CASH you make!=20

: This is perfectly legal! If you have any doubts, refer to 18 Sec. 1302 =
& 1341 of the Postal lottery laws. Keep a copy of these steps for =
yourself and, whenever you need CASH, you can use it again, and again.=20

: PLEASE REMEMBER that this program remains successful because of the =
honesty and integrity of the participants and by their carefully =
adhering to the directions. Look at it this way. If you are a person of =
integrity, the program will continue and the CASH that so many others =
have received will come your way.=20

: NOTE: You may want to retain every name and address sent to you, =
either on a computer or hard copy and keep the notes people send you. =
This VERIFIES that you are truly providing a service. (Also, it might be =
a good idea to wrap the $1 bill in dark paper to reduce the risk of mail =
theft.) So, as each post is downloaded and the directions carefully =
followed, six members will be reimbursed for their participation as a =
List Developer with one dollar each. Your name will move up the list so =
that when your name reaches the #1 position you will be receiving =
thousands of DOLLARS in CASH!!! What an opportunity for only $6.00. Send =
it now, add your own name to the bottom of the list and you're in =
business!=20

: ---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS=20

: Step 1) You do not need to re-type this entire letter to do your own =
posting. Simply put your cursor at the beginning of this letter and drag =
your cursor to the bottom of this letter, and select 'copy' from the =
edit menu. This will copy the entire letter into the computer's memory.=20

: Step 2) Open a blank 'notepad' file and place your cursor at the top =
of the blank page. From the 'edit' menu select 'paste'. This will paste =
a copy of the letter into notepad so that you can add your name to the =
list.=20

: Step 3) Save your new notepad file as a .txt file. If you want to do =
your postings in different settings, you'll always have this file to go =
back to.=20

: Step 4) Use Netscape or Internet explorer and try searching for =
various newsgroups (on-line forums, message boards, chat sites, =
discussions.)=20

: Step 5) Visit these message boards and post this article as a new =
message by highlighting the text of this letter and selecting paste from =
the edit menu. Fill in the Subject, this will be the header that =
everyone sees as they scroll through the list of postings in a =
particular group, click the post message button.=20

: You're done with your first one! Congratulations...THAT'S IT! All you =
have to do is jump to different newsgroups and post away, after you get =
the hang of it, it will take about 30 seconds for each newsgroup!=20

: **REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE CASH YOU WILL =
MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 300** That's it! You will begin =
receiving CASH from around the world within days! You may eventually =
want to rent a P.O.Box due to the large amount of mail you will receive. =
If you wish to stay anonymous, you can invent a name to use, as long as =
the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE =
CORRECT.**=20

: Now the WHY part:=20

: Out of 300 postings, say I receive only 7 replies (a very low =
example). So then I made $7.00 with my name at #6 on the letter. Now, =
each of the 7 persons who just sent me $1.00 make the MINIMUM 300 =
postings, each with my name at #5 and only 7 persons respond to each of =
the 7 original 7, that is another $49.00 for me, now those 49 each make =
300 MINIMUM posts with my name at #4 and only 7 replies each, I will =
bring in an additional $343.00! Now, those 343 persons turn around and =
post the MINIMUM 300 with my name at #3 and only receive 7 replies each, =
I will make an additional $2401.00! OK, now here is the fun part, each =
of those 2401 persons post a MINIMUM 300 letters with my name at #2 and =
they each only receive 7 replies, that just made me $16,807.00!!! Those =
16807 persons will all deliver this message to 300 newsgroups with my =
name at #1 and if still 7 persons per 300 Newsgroups react I will =
receive $117,649.00! With an original investment of only $6.00! And some =
stamps. AMAZING! When your name is no longer on the list, you just take =
the latest posting in the newsgroups, and send out another $6.00 to =
names on the list, putting your name at number 6 again. And start =
posting again.=20

: The thing to remember is: Thousands of people all over the world are =
joining the internet and reading these articles everyday? JUST LIKE YOU =
are now!! So, can you afford $6.00 and see if it really works?? I think =
so... People have said, "what if the plan is played out and no one sends =
you the CASH? So what! What are the chances of that happening when there =
are tons of new honest users and new honest people who are joining the =

internet and newsgroups everyday and are willing to give it a try? =
Estimates are at 20,000 to 50,000 new users, every day, with thousands =
of those joining the actual internet. Remember, play FAIRLY and HONESTLY =
and this will really work.=20

: ** By the way, if you try to deceive people by posting the messages =
with your name in the list and not sending the CASH to the rest of the =
people already on the list, you will NOT get as much. Someone I talked =
to knew someone who did that and he only made about $150.00, and that's =
after seven or eight weeks! Then he sent the 6 $1.00 bills, people added =
him to their lists, and in 4-5 weeks he had over $10k. This is the =
fairest and most honest way I have ever seen to share the wealth of the =
world without costing anything but our time!!! You also may want to buy =
mailing and e-mail lists for future CASH.=20

: Remember, HONESTY IS THE BEST POLICY. You don't need to cheat, the =
basic idea is to make the CASH!! GOOD LUCK to all and please play fairly =
and reap the huge rewards from this, which is tons of extra CASH. Keep =
an eye on the newsgroups and when the cash has stopped coming (that =
means your name is no longer on the list), you just take the latest =
posting at the newsgroups, send another $6.00 to the names stated on the =
list, make your corrections (put your name at #6) and start posting =
again.=20

: $$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!=20

: GOOD LUCK!!!=20

Attention!!=20
This is not a scam, this is the real deal--this is money in your=20
pocket!
Note: I made the $6 leap of faith and it is paying off =
big=20
time! You should too.
Just read what is below and see for=20
yourself. This will change your life:

$6 Investment to make =
$1000s

: Make A Lot Of Money Fast =
!!!!!

:
: A while back, I was browsing =
newsgroups,=20
just like you, I came across an article similar to this that said you =

could make=20
thousands of CASH within weeks with only an initial investment of $6.00 =
plus=20
stamps! So I thought, "Yeah, right, this must be a scam!" But like most =
of us I=20
was curious and kept reading. It said that if you send $1.00 to each of =
the 6=20
names and addresses listed in the article, you could make thousands in a =
very=20
short period of time. You then place your own name and address at the =
bottom of=20
the list at #6, and post the article to at least 300 newsgroups. (There =
are=20
about 32,000 of them out there and that's quite a large market pool). No =
catch,=20
that was it. Even though the investment was a measly $6, I had three =
questions=20
that needed to be answered before I could get involved in this sort of =
thing.=20

: 1. IS THIS REALLY LEGAL? I called a =
lawyer first.=20
The lawyer was a little sceptical that I would actually make any CASH =
but he=20
said it WAS LEGAL if I wanted to try it. I told him it sounded a lot =
like a=20
chain letter but the details of the system (SEE BELOW) actually made it =
a=20
legitimate legal business.

: 2. IS OK WITH THE POST OFFICE OR IS =
IT MAIL=20
FRAUD? I called them: 1-800-725-2161 and they confirmed THIS IS =
ABSOLUTELY=20
LEGAL! (See 18, h sections1302 NS 1341 of Postal Lottery Laws). This =
clarifies=20
the program of collecting names and addresses for a mailing list. =

: 3. IS IT RIGHT? Well, everyone who =
sends me a=20
buck has a good chance of getting A LOT of CASH ... a much better chance =
than=20
buying a lottery ticket!!! So, having these questions answered, I =
invested=20
EXACTLY $7.92 ... six $1.00 bills and six 32 cent postage stamps ... and =
boy am=20
I glad I did!!! Within 7 days, I started getting CASH in the mail! I was =

shocked! I figured it would end soon and didn't give it another thought. =
But the=20
CASH continued coming in. In my first week I made between $20 to $30. By =

the end=20
of the second week I had a made a total of $1,000.00. In the third week =
I had=20
over $10,000.00 and it was still growing. This is now my fourth week and =
I have=20
made a total of just over $42,000 and it's still coming in... =

: It's certainly worth $6.00 and 6 =
stamps !!! Also,=20
make sure you print a copy of this article NOW, so you can get the =
information=20
off of it as you need it. I promise you that if you follow the =
directions=20
exactly, that you will start making more CASH than you thought possible =
by doing=20
something so easy! Suggestion: Read this entire message carefully! =
(print it out=20
or download it.) Follow the simple directions and watch the CASH come =
in! It's=20
easy. It's legal. And, your investment is only $6.00 (Plus postage) =
IMPORTANT:=20
This is not a rip-off; it is not indecent; it is not illegal; and it is=20
virtually no risk - it really works!!!! If all of the following =
instructions are=20
adhered to, you will receive extraordinary dividends.

: PLEASE NOTE: Please follow these =
directions=20
EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program =
remains=20
successful because of the honesty and integrity of the participants. =
Please=20
continue its success by carefully adhering to the instructions. You will =
now=20
become part of the Mail Order business. In this business your product is =
not=20
solid and tangible, it's a service. You are in the business of =
developing=20
Mailing Lists. Many large corporations are happy to pay big bucks for =
quality=20
lists. However, the CASH made from the mailing lists is secondary to the =
income=20
which is made from people like you and me asking to be included in that =
list.=20

: Here are the 4 easy steps to success: =

: STEP 1: Get 6 separate pieces of =
paper and write=20
the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING =
LIST." Now=20

get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper =
so the=20
bill will not be seen through the envelope (to prevent thievery). Place =
one=20
paper in each of the 6 envelopes and seal them. You should now have 6 =
sealed=20
envelopes, each with a piece of paper stating the above phrase, your =
name and=20
address, and a $1.00 bill. What you are doing is creating a service. =
THIS IS=20
ABSOLUTELY LEGAL! You are requesting a legitimate service and you are =
paying for=20
it! Like most of us I was a little skeptical and a little worried about =
the=20
legal aspects of it all. So I checked it out with the U.S. Post Office=20
(1-800-725-2161) and they confirmed that it is indeed legal! Mail the 6=20
envelopes to the following addresses:

:
:

: #1) Aditya Venkataraman 14215 Lake =
Trail Driv=20
Sugar Land, Texas 77478

: #2) Charlie Baltimore 71-20 Sutton =
Place #3 Fresh=20
Meadows, NY 11365

: #3) Shaun Littman 3061 Clubhouse Road =
Merrick,=20
N.Y. 11566

: #4) Joseph Morris P.O. Box 37 Union =
Grove, Al=20
35175

: #5) M. Dixon P.O. Box 767412 Roswell, =
GA=20
30076

: #6) Lee Higginbotham 8505 =
Columbus Ave.=20
#209 North Hills, CA 91343
:
: STEP 2: Now take the #1 name off =
the list=20
that you see above, move the other names up (6 becomes 5, 5 becomes 4, =
etc...)=20
and add YOUR Name as number 6 on the list. DO NOT JUST COPY OVER THE =
LAST NAME,=20
BUT REMEMBER TO MOVE EACH NAME UP ONE LINE!!!!!!!!

: STEP 3: Change anything you need to, =
but try to=20
keep this article as close to original as possible. Now, post your =
amended=20
article to at least 300 newsgroups. (I think there are close to 32,000 =
groups)=20
All you need is 300, but remember, the more you post, the more CASH you =
make!=20

: This is perfectly legal! If you have =
any doubts,=20
refer to 18 Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy =
of=20
these steps for yourself and, whenever you need CASH, you can use it =
again, and=20
again.

: PLEASE REMEMBER that this program =
remains=20
successful because of the honesty and integrity of the participants and =
by their=20
carefully adhering to the directions. Look at it this way. If you are a =
person=20
of integrity, the program will continue and the CASH that so many others =
have=20
received will come your way.

: NOTE: You may want to retain every =
name and=20
address sent to you, either on a computer or hard copy and keep the =
notes people=20
send you. This VERIFIES that you are truly providing a service. (Also, =
it might=20
be a good idea to wrap the $1 bill in dark paper to reduce the risk of =
mail=20
theft.) So, as each post is downloaded and the directions carefully =
followed,=20
six members will be reimbursed for their participation as a List =
Developer with=20
one dollar each. Your name will move up the list so that when your name =
reaches=20
the #1 position you will be receiving thousands of DOLLARS in CASH!!! =
What an=20
opportunity for only $6.00. Send it now, add your own name to the bottom =
of the=20
list and you're in business!

: ---DIRECTIONS ----- FOR HOW TO POST =
TO NEWSGROUPS=20

: Step 1) You do not need to re-type =
this entire=20
letter to do your own posting. Simply put your cursor at the beginning =

of this=20
letter and drag your cursor to the bottom of this letter, and select =
'copy' from=20
the edit menu. This will copy the entire letter into the computer's =
memory.=20

: Step 2) Open a blank 'notepad' file =
and place=20
your cursor at the top of the blank page. From the 'edit' menu select =
'paste'.=20
This will paste a copy of the letter into notepad so that you can add =
your name=20
to the list.

: Step 3) Save your new notepad file as =
a .txt=20
file. If you want to do your postings in different settings, you'll =
always have=20
this file to go back to.

: Step 4) Use Netscape or Internet =
explorer and try=20
searching for various newsgroups (on-line forums, message boards, chat =
sites,=20
discussions.)

: Step 5) Visit these message boards =
and post this=20
article as a new message by highlighting the text of this letter and =
selecting=20
paste from the edit menu. Fill in the Subject, this will be the header =
that=20
everyone sees as they scroll through the list of postings in a =
particular group,=20
click the post message button.

: You're done with your first one!=20
Congratulations...THAT'S IT! All you have to do is jump to different =
newsgroups=20
and post away, after you get the hang of it, it will take about 30 =
seconds for=20
each newsgroup!

: **REMEMBER, THE MORE NEWSGROUPS YOU =
POST IN, THE=20
MORE CASH YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 300** That's =
it! You=20
will begin receiving CASH from around the world within days! You may =
eventually=20
want to rent a P.O.Box due to the large amount of mail you will receive. =
If you=20
wish to stay anonymous, you can invent a name to use, as long as the =

postman=20
will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.** =

: Now the WHY part:

: Out of 300 postings, say I receive =
only 7 replies=20
(a very low example). So then I made $7.00 with my name at #6 on the =
letter.=20
Now, each of the 7 persons who just sent me $1.00 make the MINIMUM 300 =
postings,=20
each with my name at #5 and only 7 persons respond to each of the 7 =
original 7,=20
that is another $49.00 for me, now those 49 each make 300 MINIMUM posts =
with my=20
name at #4 and only 7 replies each, I will bring in an additional =
$343.00! Now,=20
those 343 persons turn around and post the MINIMUM 300 with my name at =
#3 and=20
only receive 7 replies each, I will make an additional $2401.00! OK, now =
here is=20
the fun part, each of those 2401 persons post a MINIMUM 300 letters with =
my name=20
at #2 and they each only receive 7 replies, that just made me =
$16,807.00!!!=20
Those 16807 persons will all deliver this message to 300 newsgroups with =
my name=20
at #1 and if still 7 persons per 300 Newsgroups react I will receive=20
$117,649.00! With an original investment of only $6.00! And some stamps. =

AMAZING! When your name is no longer on the list, you just take the =
latest=20
posting in the newsgroups, and send out another $6.00 to names on the =
list,=20
putting your name at number 6 again. And start posting again. =

: The thing to remember is: Thousands =
of people all=20
over the world are joining the internet and reading these articles =
everyday?=20
JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really =
works?? I=20
think so... People have said, "what if the plan is played out and no one =
sends=20
you the CASH? So what! What are the chances of that happening when there =
are=20
tons of new honest users and new honest people who are joining the =
internet and=20
newsgroups everyday and are willing to give it a try? Estimates are at =
20,000 to=20
50,000 new users, every day, with thousands of those joining the actual=20

internet. Remember, play FAIRLY and HONESTLY and this will really work.=20

: ** By the way, if you try to deceive =
people by=20
posting the messages with your name in the list and not sending the CASH =
to the=20
rest of the people already on the list, you will NOT get as much. =
Someone I=20
talked to knew someone who did that and he only made about $150.00, and =
that's=20
after seven or eight weeks! Then he sent the 6 $1.00 bills, people added =
him to=20
their lists, and in 4-5 weeks he had over $10k. This is the fairest and =
most=20
honest way I have ever seen to share the wealth of the world without =
costing=20
anything but our time!!! You also may want to buy mailing and e-mail =
lists for=20
future CASH.

: Remember, HONESTY IS THE BEST POLICY. =
You don't=20
need to cheat, the basic idea is to make the CASH!! GOOD LUCK to all and =
please=20
play fairly and reap the huge rewards from this, which is tons of extra =
CASH.=20
Keep an eye on the newsgroups and when the cash has stopped coming (that =
means=20
your name is no longer on the list), you just take the latest posting at =
the=20

4052. modifying phone modem for use on HF

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-25 00:00:00 UTC
From: Jeffrey Krehbiel <jeffrey_krehbiel@hotmail.com>
Message-ID: <8qofm1$gu2$1@nnrp1.deja.com>
Source record: 10792

I seem to remember seeing an article some time ago that talked about using phone modems on HF for RTTY, AMTOR, etc. I have not been able to find any information on the subject, and was hoping someone else had heard of this and could point me in the right direction. I have a couple of Hayes 2400 modems that can be set for the old Bell 300 / 1200 baud modes, and am in the mood to experiment :) Thanks!

Weather data is pretty common, but any number of other data items - not just lat/long. Maybe you want to send your mobile station some info about your fixed station (i.e, "you have mail" - mail you don't need while mobile, "your house is on fire"). The position info is not the "real" payload, and there is really no limit to what the payload could be (well, stock quotes would be a bad idea ;-)

> Maybe there's a real need there, that I'm having trouble seeing. If there
> is, don't worry about it. Lots of unattended VHF/UHF Packet stations

I would hope that if APRS applications do start popping up on 70cm, that folks would standardize on one frequency, and standardize on 9600bps.

It will be harder to standardize on a UHF nationwide frequency, because there isn't even a single standard UHF 9600bps coordinated frequency yet. I think the ARRL came up with some "suggested" ones in the early 90's - but they weren't any good for the Southern California area, because of the Pt. Mugu radar problem.

If the mod doesn't allow all users on the channel to run with low
TxDelay settings(on the order of 5-8) - then don't bother, as you won't
be able to "play with the others" on the channel. Besides, with high
TxDelay settings, your thruput won't be significantly better than at
120bps.

Get a dedicated data radio. TEKKs are good, and cheap.

himself.

"D. Stussy" appears to be unhappy that I recently pointed out his anti-ham LandLine Lid rhetoric, and considers my doing so to be an "unprovoked, personal attack"...

Is he related to Bill Clinton, I wonder?

Then I pointed out the fact that Steve, for all his pretended respect for the rules, is one of those LandLine Lids who thinks that we should use Amateur Packet Radio as a way to provide Internet access, despite the fact that doing so would most certainly lead to illegal content being transmitted over the Ham bands. - Another "unprovoked, personal attack ", D. Stussy claims.

Maybe he's related to "Hillary"?

;-)

LandLine Lids such as Steve and D. Stussy "provoke" me to point out their anti-Ham activities... This is no "attack"... If they are ashamed of what they are doing and feel "attacked" when it's pointed out, perhaps they should consider modifying their behavior.

D. Stussy calls me "Mr. CB", but it's him and those of his ilk who have been indulging in anti-Ham behavior, not me. Perhaps he should give THAT a bit of thought as well. - If he's up to the job.

> Attention!! This is not a scam, this is the real deal--

It's not a scam... Just a felony.

So... You don't think this is illegal huh?

By the way here's what the US postal inspector's office says about it.

A chain letter is a "get rich quick" scheme that promises that your mail box will soon be stuffed full of cash if you decide to participate. You're told you can make thousands of dollars every month if you follow the detailed instructions in the letter.

A typical chain letter includes names and addresses of several individuals whom you may or may not know. You are instructed to send a certain amount of money--usually $5--to the person at the top of the list, and then eliminate that name and add yours to the bottom. You are then instructed to mail copies of the letter to a few more individuals who will hopefully repeat the entire process. The letter promises that if they follow the same procedure, your name will gradually move to the top of the list and you'll receive money -- lots of it.

There's at least one problem with chain letters. They're illegal if they request money or other items of value and promise a substantial return to the participants. Chain letters are a form of gambling, and sending them through the mail (or delivering them in person or by computer, but mailing money to participate) violates Title 18, United States Code, Section 1302, the Postal Lottery Statute. (Chain letters that ask for items of minor value, like picture postcards or recipes, may be mailed, since such items are not things of value within the meaning of the law.)

Recently, high-tech chain letters have begun surfacing. They may be disseminated over the Internet, or may require the copying and mailing of computer disks rather than paper. Regardless of what technology is used to advance the scheme, if the mail is used at any step along the way, it is still illegal.

The main thing to remember is that a chain letter is simply a bad investment. You certainly won't get rich. You will receive little or no money. The few dollars you may get will probably not be as much as you spend making and mailing copies of the chain letter.

Chain letters don't work because the promise that all participants in a chain letter will be winners is mathematically impossible. Also, many

people participate, but do not send money to the person at the top of the list. Some others create a chain letter that lists their name numerous times -- in various forms with different addressee. So, in reality, all the money in a chain is going to one person.

Do not be fooled if the chain letter is used to sell inexpensive reports on credit, mail order sales, mailing lists, or other topics. The primary purpose is to take your money, not to sell information. "Selling" a product does not ensure legality. Be doubly suspicious if there's a claim that the U.S. Postal Service or U.S. Postal Inspection Service has declared the letter legal. This is said only to mislead you. Neither the Postal Service nor Postal Inspectors give prior approval to any chain letter.

Well, I don't claim to be an expert on APRS, but it does appear to be
the case that APRS is really intended to run a "context" on one frequency
regardless of the geographical area or number of users covered. Isolated
"contexts" can exist, if you're just interested in a sub-set of users.

The protocol *seems* to attempt to scale to larger areas or number of
users by adaptive timeouts rather than a architecture of gateways
or proxies. I tend to question the capability of this approach myself,
but I'm not an expert. Perhaps I should have a closer look.

So, in the context of a nationwide APRS context, a single frequency
makes sense, but there's no reason why regional frequencies could
be used for sub-sets of the nationwide context.

> It will be harder to standardize on a UHF nationwide frequency, because
> there isn't even a single standard UHF 9600bps coordinated frequency

This doesn't make much sense to me. It didn't seem all that easy to move APRS
to 144.39MHz just because they'd set up camp elsewhere. So, I tend to disagree.

> I think the ARRL came up with some "suggested" ones in the early
> 90's - but they weren't any good for the Southern California area,

Is APRS really *that* old that the ARRL would have proposed nationwide frequencies
in the early 1990s? I think APRS itself was only hatched around 1992. OK, enough
of the hair-splitting.

Pt. Mugu is only one of many areas in SoCal plaugued by primary users of the
UHF band (of which amateurs are secondary users). Edwards AFB and Palmdale
Plant 42 frequently encounter RADAR interference - the only thing that's made
RADAR interference better is the number of base-closings during the 1990s.

I tend to suspect almost any location in the United States has local RADAR
often enough to notice.

When a couple of us here locally wanted to experiment with 9600
when Gracilis came out with their card we set up on a frequency down
in the 430 range. This turned out to be a bad idea, as none of the
dual-band Omni's like Diamond and Comet had any gain down there.
We started out using beams, but found cheap Omni's with mucho
gain didn't work down there.

Anyway, if you do start something up, I would try to keep it in the
445 - 446 area. We have a 1200 baud freq of 446.775 in most of OK
which was used for BBS backbone back in its big days.

I think contacting a coordinator was a good suggestion, as they
will know the unpublished aux links, and help you from causing a
big stink. Even then I would put a recorder on the freq for a few
days (I use one of those radio-shack recorders that record when
the squelch breaks (get to hear the cops for a whole day in 15
minutes, ha), as there may be an un-coordinated Ham doing their
thing right smack dab where you want to do your thing.

I think it's mostly a Navy thing anymore. The USAF has pretty much
abandoned the UHF band for radar, other than some of the missile
detection systems (which I hear have been mothballed mostly). More
likely to find wind profilers from the Weather Service than a pulse radar :-)

I think the E-2 Hawkeye can do 460 MHz, I don't know about lower, but
we hardly see them around here anymore. The nearest radar to me is a
1.2 GHz FAA Long Range Radar (LRR) about 4 miles east, and the rest
are S band around here.

4062. Alinco two-meter handhelds for sale.

I have two handheld radios for sale. Both are Alinco DJ-195 handhelds and transmit on amateur radio two-meter frequencies, which is 144 to 148 MHz. They transmit at 5 watts, and have worked on simplex at a little over five miles. Using a repeater you gain substantially more range. Both come with speaker microphones as well as surveillance microphones. They come with two wall chargers, one car charger and a suction cup antenna mount for use inside your car. Keep in mind you need an amateur radio license to transmit on two-meter frequencies. I'll sell the whole package for $300 plus shipping.

You can view the radio and specs at:

http://www.alinco.com/Products/DJ-195

Also have a Radio Shack scanner for sale. Works with trunked systems, and scans from 29 MHz to 900Mhz. Cellular frequencies are blocked. Will sell it, plus two rechargable battery packs, for $100 plus shipping.

If you're interested, please e-mail me at wellsa@conceptsnet.com or call (206) 222-7521.

Thanks.

Do the same thing here. Try to hit 'em all at least once per
month in case there are firmware updates, new products, etc.

I know exactly who you mean with the broken email.
A simple query about an older product never got a reply.

Some manufacturers do better.
A query to HAL got a reply from the president, same day.

> It's almost like they are making too much money as it is, but
> I suspect that they can just barely meet demand, and advertising
> would only run up manufacturing costs to get to the next
> level. I'm only guessing...

From what I know, this is in fact the situation. Demand for higher
speed network gear is just not there. One needs the hype to
build that demand before any manufacturer will be able to put
together a business plan that makes any sense. I've tried putting
together a couple business plans for such products, and although
one of the scenarios looked like it might work, the potential ROI
just didn't look worth the bother. Events have born out my
decision not to put my money where my mouth was.

The successful business plans count on revenue from non-ham
sources. In some cases, essentially all *profit* comes from

those sources, and the ham products only exist because of
specific interest by the business owner.

Software products are a different kettle of fish. I suspect several
hams have made reasonable amounts of money with their software.

>Is that a legal limit, or a technology limit ?

Neither, just attitudes, lack of interest, etc. However there is some
technology limits, in that higher rates are pretty much limited to higher
frequencies, which limit the effective range, thus limiting the pool of
possible correspondents. E.g. my 2.4ghz experiments pretty much require
someone within a few miles of me. And I need an elmer. None found yet...

>Well, I am not a ham, as stated before. Most of the guys I have worked with over

Yup, but fewer and fewer... It is hard to tinker when you can go into WalMart
and buy something that seems to do it all and more and better. And, when that
gadget is hard to open and modify it really puts a damper on things.

But there is still room, just not a lot of interest. And as you see by some
of the tangental discussions to your post, some seem to think we should just
can the whole thing. Oh well. To each his own, and hopefully the law will
continue to allow room for the individual experimenter.

The Southern California area is one of a few that was "specifically"
referred to in older editions of the Part 97 FCC rules. There were

others - i.e., there was one area centered in Eastern New Mexico(White Sands). I think the FCC has deleted many of the specific geographic references. My FCC manual is old enough that it still has them. In any event, we are "secondary" on 420-430, and this part of the 70cm band gets "blasted" in SoCal. I'm sure it gets hit in other parts of the country as well. My point is - the frequencies that this old ARRL article tried to coordinate for packet were in this "bad" area. The net result is that there are NO useful coordinated standard 9600bps or higher 70cm frequencies in the US. Pretty ridiculous.

By the way, we've standardized on frequencies around 439.000 in SoCal. I think there were 438.950, 438.975, 439.000, 439.025, 439.050. If you were getting a TEKK radio crystal cut - 439.025 was your best bet.

I was on 439.025 for a long time with a Flexar; just couldn't hear too
much activity out in the boonies - in fact, I think I can enumerate every
station that ever regularly emitted a 9k6 peep out in the Antelope Valley
on one hand, and we were all on 439.025.

The TEKK radios are neat enough for a metropolitan area context but
were not particularly effective over the relatively long distances we had
to deak with. Land mobiles were really required.

I once read an adendum in the back of a Hayes manual that gave the proper command sequences to use the 1200 baud mode to send ascii on the air. It even showed how to use the "on hook" relay to key the transmitter!

I am sure I threw it out ten years ago, but it was in the back of a hays book for an external modem.

Good Luck!

The rules state you must be "in control" of your station(s).

I suppose you could have 20 or 30 stations if you like...as long as
you can control them somehow.

1) Very interesting that "Mr. CB" classifies me as a "LLL" although I have
NEVER passed any radio origined or destined traffic via any wireline
connection. I don't even run a packet BBS (but I have used them - and those
which I have used don't forward over the phone lines).

2) Also interesting that he objects to being called "Mr. CB" even though C followed by B are his initials of his true name.

3) Note that I did NOT say that you personally attacked ME. I simply stated that your only contribution on the subject was to attack someone else. Go back to trollville.

Note that here in Southern California, the entire 440-450MHz segment, except for about 4 pairs, are coordinated to repeaters. Out of those 8 frequencies which are not, only one is allocated to any digital mode (and it is used for BBS mail forwarding only).

The "socal" digital allocations are at 431 MHz and 439 MHz.

As for antennas, Comet and Diamond do make antennas that are resonant in the 435 MHz range, but one has to order them with a slightly adjusted part number. Using the normal part number will result in an antenna centered around 445 MHz, as you found out.

Lastly, although some people may be uncoordinated, I believe you meant to refer to an uncoordinated radio operation, not the person, unless you were referring to a specific situation. ;-)

For years, the radar planes sent out to interdict drug smugglers have regularly trashed out the 440 MHz 9.6kb "backbone" links of the TexNet Packet network, from central Texas, all the way down to the border. (300 mi. footprint affected) Why the TexNet folks used 440Mhz for their backbone links in the first place, then continued to put new ones in after this problem came up is hard to understand. SEDAN does just fine with their 6-meter 9.6kb backbone, with no comparable interference problems. Other nets do just fine, using the 220 MHz stuff.

>Is there any established protocol like 1 transmission every X minutes
>or is it sort of a free form thing left up to the operator.

A good system will adapt the rate of transmissions to the movement of the
vehicle. I.e. when the vehicle is moving slow it will transmit less
frequently than when it is moving fast. You can then set it to "transmit
every Y minutes or when the position has moved a distance more than Y
from the previously transmitted position".

It is also possible to listen to re-transmissions via a digipeater.
When it hears back re-transmissions of its own beacons it should transmit
less frequently than when it does not hear such re-transmissions.

I don't know what is written in the USA regulations, but from the above it seems to me that there is a potential confusion about what "control" really means.

I can think of "automatic control" meaning that an automated system is somehow controlling the switching on/off of the transmitter (as it is done on packet: the AX.25 software completely automatically controls the transmitter, independently from what the operator types or does). This would be different from "manual control" e.g. with a voice transmitter that keys when you push a PTT button.
With packet, there is "automatic control" even when the operator is present, in this definition.

I can also think of "automatic control" meaning a completely autonomous system being completely automatically run. Like a repeater, packet BBS, APRS station with weather data.

The important point probably is (it would have been here, until the governing bodies lost all interest in what is happening inside the bands) "are in control of your station in case it misbehaves".
They should be able to contact you (at your station address or telephone number) and you should then be able to control the station (turn it off when it causes interference or operates/is being operated beyond the limits specified in the license). When you can do that, you are "in control" of your station. But most mobile APRS users with a station at home left unattended probably can't.

4079. Algorithm for decoding RTTY (Linux project)

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-27 00:00:00 UTC
From: magne@radar.no
Message-ID: <C9mA5.1050$o9.16464@news1.online.no>
Source record: 10819

I was thinking about writing an RTTY modem for Linux, using the
sound card (/dev/audio) interface (since I can't seem to find something
like this out there). Not being a DSP guru, I'd like to present some
thoughts..

1. Detector
I guess the approach with adding the input signal with predefined
waveforms (0 and 90 degrees for each of the two frequencies),
and then passing it through an integrate-and-dump (as
described in Tom McDermott's book) is ok ?

What would be a suitable integration time? 8 integrations pr. bit,
perhaps? (to allow for adjusting to match edges better)

2. Decoder
One alternative is to shift the detector output into a shift-register,
and look for something that matches a valid Baudot character.
Are there better methods ?

Any comments?

Source record: 10820

Dear Friend,

This really works! Have the faith, don't miss this opportunity, get involved also, and it will work for you as it does for us!!!!!

Thank you for your time and interest.

This email contains the ENTIRE PLAN of how YOU can make $50,000 or more in the next 90 days simply sending email!

Seem impossible? Just read on and see how easy this is....

Due to the popularity of this letter on the Internet, a major nightly news program recently devoted an entire show to the investigation of the program described below to see if it really can make people money.

The show also investigated whether or not the program was legal. Their findings proved that there are absolutely no laws prohibiting participation in the program. This has helped to show people that this is a simple, harmless and fun way to make some extra money at home.

The results have been truly remarkable. So many people are participating

that those involved are doing much better than ever before. Since everyone makes more as more people try it out, its been very exciting.

You will understand once you try it yourself!

********* THE ENTIRE PLAN IS HERE BELOW *********

*** Print This Now For Future Reference ***

$$

If you would like to make at least $50,000 in less than 90 days, please read this program...THEN READ IT AGAIN!!

$$

THIS IS A LEGITIMATE, LEGAL, MONEY MAKING OPPORTUNITY!!

It does NOT require you to come into contact with people or make or take any telephone calls. Just follow the instructions, and you will make money. This simplified e-mail marketing program works perfectly 100% EVERY TIME!

E-mail is the sales tool of the future. Take advantage of this virtually

free method of advertising NOW!!! The longer you wait, the more people will be doing business using email. Get your piece of this action!!!

~~~~~~

Hello - My name is Johnathon Rourke, I'm from Rhode Island.

The enclosed information is something I almost let slip through my fingers. Fortunately, sometime later I re-read everything and gave some thought and study to it. Two years ago, the corporation I worked for for

the past twelve years down-sized and my position was eliminated. After unproductive job interviews, I decided to open my own business. Over the

past year, I incurred many unforeseen financial problems. I owed my family, friends and creditors over $35,000. The economy was taking a toll on my business and I just couldn't seem to make ends meet. I had to refinance and borrow against my home to support my family and struggling business.

AT THAT MOMENT something significant happened in my life. I am writing toshare the experience in hopes that this could change your life FOREVER. FINANCIALLY$$$!!!

In mid December, I received this program in my e-mail. Six months prior to receiving this program I had been sending away for information on various business opportunities. All of the programs I received, in my opinion, were not cost effective. They were either too difficult for me to comprehend or the initial investment was too much for me to risk to see if they would work. But as I was saying, in December of 1997 I received this program. I didn't send for it, or ask for it, they just got my name off a mailing list.

THANK GOODNESS FOR THAT!!! After reading it several times, to make sure I was reading it correctly. I couldn't believe my eyes! Here was a MONEY MAKING MACHINE I could start immediately without any debt.

Like most of you I was still a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161 24-hrs) and they confirmed that it is indeed legal!

After determining the program was LEGAL I decided "WHY NOT!?!??"

Initially I sent out 10,000 e-mails. It cost me about $15 for my time on-line. The great thing about e-mail is that I don't need any money for

printing to send out the program, and because I also send the product (reports) by e-mail, my only expense is my time.

In less than one week, I was starting to receive orders for REPORT #1. By January 13, I had received 26 orders for REPORT #1. Your goal is to "RECEIVE at least 20 ORDERS FOR REPORT #1 WITHIN 2 WEEKS. IF YOU DON'T, SEND OUT MORE PROGRAMS UNTIL YOU DO.

My first step in making $50,000 in 90 days was done. By January 30, I had received 196 orders for REPORT #2. Your goal is to "RECEIVE AT LEAST 100+ ORDERS FOR REPORT #2 WITHIN 2 WEEKS. IF NOT, SEND OUT MORE
~~~~~~

PROGRAMS UNTIL YOU DO. ONCE YOU
HAVE 100 ORDERS, THE REST IS EASY, RELAX, YOU WILL MAKE YOUR $50,000
GOAL."

Well, I had 196 orders for REPORT #2, 96 more than I needed. So I sat
back and relaxed. By March 1, of my e-mailing of 10,000, I received
$58,000 with more coming in every day. I paid off ALL my debts and
bought a much needed new car!

Please take your time to read this plan, IT WILL CHANGE YOUR LIFE
FOREVER$!!! Remember, it won't work if you don't try it. This program
does work, but you must follow it EXACTLY!

Especially the rules of not trying to place your name in a different
place.
It won't work and you'll lose out on a lot of money! In order for this
program to work, you must meet your goal of 20+ orders for REPORT #1,
and 100+ orders for REPORT #2 and you will make $50,000 or more in 90 days.

I AM LIVING PROOF THAT IT WORKS!!! If you choose not to participate in
this program, I am sorry. It really is a great opportunity with little
cost or risk to you. If you choose to participate, follow the program
and you will be on your way to financial security. If you are a fellow
business owner and are in financial trouble like I was, or you want to
start your own business, consider this a sign. I DID! $$

Sincerely,

Johnathon Rourke
~~~~~~

A PERSONAL NOTE FROM THE ORIGINATOR OF THIS PROGRAM:

By the time you have read the enclosed program and reports, you should
have
concluded that such a program, and one that is legal, could not
have been created by an amateur. Let me tell you a little about myself.
I
had a profitable business for 10 years. Then in 1979 my business
began falling off. I was doing the same things that were previously
successful for me, but it wasn't working. Finally, I figured it out. It
wasn't
me, it was the economy. Inflation and recession had replaced the stable
economy that had been with us since 1945.

I don't have to tell you what happened to the unemployment
rate...because
many of you know from first hand experience. There were more
failures and bankruptcies than ever before. The middle class was
vanishing.
Those who knew what they were doing invested wisely and
moved up. Those who did not, including those who never had anything to
save
~~~~~~

or invest, were moving down into the ranks of the poor. As
the saying goes, "THE RICH GET RICHER AND THE POOR GET POORER." The
traditional methods of making money will never allow you
to "move up" or "get rich." Inflation will see to that.

You have just received information that can give you financial freedom
for
the rest of your life, with "NO RISK" and "JUST A LITTLE BIT OF
EFFORT." You can make more money in the next few months than you have
ever
imagined. I should also point out that I will not see a penny
of this money, nor anyone else who has provided a testimonial for this
program.

I have retired from the program after sending thousands and thousands of

programs. Follow the program EXACTLY AS INSTRUCTED. Do not
change it in any way. It works exceedingly well as it is now. Remember
to
e-mail a copy of this exciting report to everyone you can think of.
One of the people you send this to may send out 50,000...and your name
will
be on every one of them! Remember though, the more you send
out, the more potential customers you will reach. So my friend, I have
given you the ideas, information, materials and opportunity to become
financially independent.

IT IS UP TO YOU!! NOW DO IT!!

~~~~~~

Before you delete this program from your in box, as I almost did, take a

little time to read it and REALLY THINK ABOUT IT. Get a pencil and
figure out what could happen when YOU participate. Figure out the worst
possible response and no matter how you calculate it, you will still
make a lot of money! You will definitely get back what you invested. Any

doubts you have will vanish when your first orders come in.

$$$ IT WORKS!!! $$$

Jody Jacobs Richmond, VA

~~~~~~

HERE&#65533;S HOW THIS AMAZING PROGRAM WILL MAKE YOU THOUSANDS OF
DOLLAR$$$$!!!!

This method of raising capital REALLY WORKS 100% EVERY TIME. I am sure
that
you could use up to $50,000 or more in the next 90 days.
Before you say "BULL... ", please read this program carefully. This is
not

a chain letter, but a perfectly legal money making business.

As with all multi-level businesses, we build our business by recruiting new
partners and selling our products. Every state in the USA allows you
to recruit new multi-level business partners, and we sell and deliver a
product for EVERY dollar received.

YOUR ORDERS COME BY MAIL AND ARE FILLED BY E-MAIL, so you are not involved
in personal selling. You do it privately in your own
home, store or office. This is the EASIEST marketing plan anywhere! It is
simply order-filling by email!

****
The product is informational and instructional material, keys to the secrets
for everyone on how to open the doors to the magic world of E-
COMMERCE, the information highway, the wave of the future!

PLAN SUMMARY:

(1) You order the 4 reports listed below ($5 US each.) They come to you by
email.

(2) Save a copy of this entire letter and put your name after Report #1 and
move the other names down.

(3) Via the internet, access Yahoo.com or any of the other major search
engines to locate hundreds of bulk email service companies (search for
"bulk email") and have them send 25,000 - 50,000 emails for you about
$49+).

(4) Orders will come to you by postal mail - simply email them the Report
they ordered. Let me ask you - isn't this about as easy as it gets?

****

By the way there are over 50 MILLION email addresses with millions more
joining the internet each year so don't worry about "running out" or
"saturation". People are used to seeing and hearing the same advertisements
every day on radio/TV. How many times have you received the
same pizza flyers on your door? Then one day you are hungry for pizza and
you order one. Same thing with this letter. I received this letter
many times - then one day I decided it was time to try it.

****

YOU CAN START TODAY - JUST DO THESE EASY STEPS:

STEP #1. ORDER THE FOUR REPORTS

Order the four reports shown on the list below (you can't sell them if you don't order them). -- For each report, send $5.00 (US) CASH, the NAME & NUMBER OF THE REPORT YOU ARE ORDERING, YOUR E-MAIL ADDRESS, and YOUR NAME & RETURN ADDRESS (in case of a problem) to the person whose name appears on the list next to the report.
MAKE SURE YOUR RETURN ADDRESS IS ON YOUR ENVELOPE IN CASE OF ANY MAIL PROBLEMS! Within a few days you will receive, by e-mail, each of the four reports. Save them on your computer so you can send them to the 1,000's of people who will order them from you.

STEP #2. ADD YOUR MAILING ADDRESS TO THIS LETTER

a. Look below for the listing of the four reports.
b. After you've ordered the four reports, delete the name and address under REPORT #4. This person has made it through the cycle.
c. Move the name and address under REPORT #3 down to REPORT #4.
d. Move the name and address under REPORT #2 down to REPORT #3.
e. Move the name and address under REPORT #1 down to REPORT #2.
f. Insert your name and address in the REPORT #1 position.
Please make sure you COPY ALL INFORMATION, every name and address, ACCURATELY!

STEP #3. SAVE THIS LETTER

Take this entire letter, including the modified list of names, and save it to your computer. Make NO changes to these instructions. Now you are ready to use this entire email to send by email to prospects.

Report #1 will tell you how to download bulk email software and email addresses so you can send it out to thousands of people while you sleep!

Remember that 50,000+ new people are joining the internet every month.

Your cost to participate in this is practically nothing; surely you can afford $20 (US) and initial bulk mailing cost. You obviously already have a computer and an Internet connection and e-mail is FREE!

There are two primary methods of building your downline:

METHOD #1: SENDING BULK E-MAIL Let's say that you decide to start small,

just to see how it goes, and we'll assume you and all those
involved email out only 2,000 programs each. Let's also assume that the
mailing receives a 0.5% response. The response could be much
better. Also, many people will email out hundreds of thousands of
programs
instead of 2,000. (Why stop at 2000?). But continuing with this
example, you send out only 2,000 programs. With a 0.5% response, that is

only 10 orders for

REPORT #1. Those 10 people respond by sending out 2,000 programs each
for a
total of 20,000. Out of those 0.5% 100 people respond and
order

REPORT #2. Those 100 mail out 2,000 programs each for a total of
200,000.
The 0.5% response to that is 1,000 orders for

REPORT #3. Those 1,000 send out 2,000 programs each for a 2,000,000
total.
The 0.5% response to that is 10,000 orders for

REPORT #4. That's 10,000 $5 bills for you. CASH!!!

Your total income in this example is $50 + $500 + $5,000 + $50,000 for a

total of $55,550!!!

REMEMBER FRIEND, THIS IS ASSUMING 1,990 OUT OF THE 2,000 PEOPLE YOU MAIL
TO
WILL DO ABSOLUTELY NOTHING AND
TRASH THIS PROGRAM! DARE TO THINK FOR A MOMENT WHAT WOULD HAPPEN IF
EVERYONE, OR HALF SENT OUT 100,000
PROGRAMS INSTEAD OF 2,000. Believe me, many people will do just that,
and
more!

METHOD #2: PLACING FREE ADS ON THE INTERNET
Advertising on the internet is very, very inexpensive, and there are
HUNDREDS of FREE places to advertise. Let's say you decide to start
small just to see how well it works. Assume your goal is to get ONLY 10
people to participate on your first level. (Placing a lot of FREE ads on

the Internet will EASILY get a larger response.) Also assume that
everyone
else in YOUR ORGANIZATION gets ONLY 10 downline members.
Look how this small number accumulates to achieve the STAGGERING results

below:

1st level--your first 10 send you
$5.................................$50
2nd level--10 members from those 10 ($5 x 100).............$500
3rd level--10 members from those 100 ($5 x 1000).........$5,000

4th level--10 members from those 1000 ($5 x 10,000)..$50,000

$$$$$$ THIS TOTALS ----------$55,550 $$$$$$

AMAZING ISN'T IT? Remember friends, this assumes that the people who participate only recruit 10 people each. Think for a moment what would happen if they got 20 people to participate! Most people get 100's of participants and many will continue to work this program, sending out programs WITH YOUR NAME ON THEM for years! THINK ABOUT IT!

~~~~~~

People are going to get emails about this plan from you or somebody else and many will work this plan. The question is, don't you want your name to be on the emails they will send out?

* * * DON'T MISS OUT!!! * * * JUST TRY IT ONCE!!! * * *

* * SEE WHAT HAPPENS!!! *** YOU'LL BE AMAZED!!!* *

~~~~~~

ALWAYS PROVIDE SAME-DAY SERVICE ON ALL ORDERS!

This will guarantee that the e-mail THEY send out with YOUR name and address on it will be prompt because they can't advertise until they receive the report!

~~~~~~

GET STARTED TODAY: PLACE YOUR ORDER FOR THE FOUR REPORTS NOW.

Notes: ALWAYS SEND $5 CASH (U.S. CURRENCY) FOR EACH REPORT. CHECKS NOT ACCEPTED. Make sure the cash is concealed by wrapping it in two sheets of paper. On one of those sheets of paper write:

(a) the number & name of the report you are ordering

(b) your e-mail address, and

(c) your name & postal address.

REPORT #1 "The Insider's Guide to Advertising for Free on the Internet"

ORDER REPORT #1 FROM:
Andrew Skidmore
9379 Alexander Rd
Alexander, NY 14005
USA

REPORT #2 "The Insider's Guide to Sending Bulk E-mail on the Internet"
~~~~~~

ORDER REPORT #2 FROM:
Lars Pedersen
Skejbygaardsvej 7, 1, 10
8240 Risskov
Denmark

REPORT #3 "The Secrets to Multilevel Marketing on the Internet"

ORDER REPORT #3 FROM:
John Cole Werner
PO Box 3281
Lihue, HI 96766

REPORT #4 "How to become a Millionaire utilizing the Power of Multilevel

Marketing and the Internet"

ORDER REPORT #4 FROM:
Zac Majors
2242 E Woodchuck Way
Sandy, UT 84093

******* TIPS FOR SUCCESS *******

TREAT THIS AS YOUR BUSINESS! Be prompt, professional, and follow the
directions accurately. Send for the four reports IMMEDIATELY
so you will have them when the orders start coming in because: When you
receive a $5 order, you MUST send out the requested
product/report. It is required for this to be a legal business and they
need the reports to send out their letters (with your name on them!)

-- ALWAYS PROVIDE SAME-DAY SERVICE ON THE ORDERS YOU RECEIVE. -- Be
patient
and persistent with this program - If you follow
the instructions exactly - results WILL FOLLOW. $$$$

******* YOUR SUCCESS GUIDELINES *******

Follow these guidelines to guarantee your success: If you don't receive
20
orders for REPORT #1 within two weeks, continue advertising or
sending e-mails until you do. Then, a couple of weeks later you should
receive at least 100 orders for REPORT #2. If you don't, continue
advertising or sending e-mails until you do. Once you have received 100
or
more orders for REPORT #2, YOU CAN RELAX, because the
system is already working for you, and the cash will continue to roll
in!

THIS IS IMPORTANT TO REMEMBER: Every time your name is moved down on the

list, you are placed in front of a DIFFERENT report. You
can KEEP TRACK of your PROGRESS by watching which report people are
ordering
from you.

To generate more income, simply send another batch of e-mails or continue
placing ads and start the whole process again! There is no limit to
the income you will generate from this business!

Before you make your decision as to whether or not you participate in this
program, please answer one question. ARE YOU HAPPY WITH
YOUR PRESENT INCOME OR JOB? If the answer is no, then please look at the

following facts about this super simple MLM program:

1. NO face to face selling, NO meetings, NO inventory! NO Telephone calls,
NO big cost to start! NOthing to learn, NO skills needed! (Surely
you know how to send email?)

2. No equipment to buy - you already have a computer and internet connection
- so you have everything you need to fill orders!

3. You are selling a product which does NOT COST ANYTHING TO PRODUCE OR
SHIP! (Emailing copies of the reports is FREE!)

4. All of your customers pay you in CA$H! This program will change your
LIFE FOREVER!! Look at the potential for you to be able to quit your
job and live a life of luxury you could only dream about! Imagine getting
out of debt and buying the car and home of your dreams and being
able to work a super-high paying leisurely easy business from home!

$$$ FINALLY MAKE SOME DREAMS COME TRUE! $$$

ACT NOW! Take your first step toward achieving financial independence.
Order the reports and follow the program outlined above--
SUCCESS will be your reward.

Thank you for your time and consideration.

PLEASE NOTE: If you need help with starting a business, registering a
business name, learning how income tax is handled, etc., contact your
local office of the Small Business Administration (a Federal Agency) at
1-800-827-5722 for free help and answers to questions.

Also, the Internal Revenue Service offers free help via telephone and free
seminars about business tax requirements. Your earnings are highly
dependent on your activities and advertising. The information contained on
this site and in the report constitutes no guarantees stated nor
implied. In the event that it is determined that this site or report
constitutes a guarantee of any kind, that guarantee is now void. The earnings
amounts listed on this site and in the report are estimates only. If you

have any questions of the legality of this program, contact the Office
of
Associate Director for Marketing Practices, Federal Trade Commission,
Bureau
of Consumer Protection in Washington, DC.

If you need some example sourcecode for rtty, amtor and pactor using
soundcard linux, look at:
http://www.ife.ee.ethz.ch/~sailer/ham/linux/hf.html

Does not compile out of the box on current systems, however. You
need to use the userland implementation of hf_kernel and tweak
with some assembler code current gcc seem to have problems with.

The DSP part of this is already in the kernel, and accessible via
/dev/hfmodem. It can be enabled in the configuration when needed.

I don't know what userprogram supports this device, there is no
documentation in the sourcecode... it only says it was written by Thomas
Sailer (sailer@ife.ee.ethz.ch).

As far as I know the kernel part will disappear in future linux
version because it is hard to maintain and only supports very
few soundcards. At Thomas' site you find 3 parts: the DSP-stuff
as kernel-land implementation (hfkernel_kernel), the DSP things
for usermode (hfkernel_user) and the terminal itself. You need
either ther usermode hfkernel or the kernelmode hfkernel. The
double meaning of "kernel" is a little confusing in this case...
The usermode kernel uses the standard linux sounddrivers and
should work with current hardware where the hfkernel_kernel
only supports ISA Soundblaster compatible cards with aren't
manufactured any more. You have to apply a patch for glibc2
systems and even then there is a compilation problem with
current gcc which prevented me from playing around with this.
It seems with current gcc you can't access the "%eax" register
from inline assembler anymore. Something like that, tried
it some time ago, forgot the details.

What you are actually seeing is related to Amateur Radio in a general sense. We don't conduct business on Ham Radio. No commercials, no "cashing in" on the air, and most certainly no indecency there.

We all know what's on the Internet, and all Hams who have a clue about the hobby know that 90% or more of what you find there is inappropriate for the Ham bands. Only a moronic LandLine Lid would have a problem understanding that, and go on to promote the use of Amateur Radio for casual Internet access.

I don't think Ham Radio is going to die, but I do see where the "LandLine Lid" mentality will not last long in the hobby. As more and more Hams come to understand the fact that LandLine Lids are willing to toss the essential decency of Ham Radio for the most trivial and self-serving of purposes, being a "LandLine Lid" takes you further and further beyond the pale. - Exactly where you belong.

Get a CB radio, if you can't understand or abide common decency. Your kind has already had their way there. Go where you belong, with all your "good buddies". No rules! Go for it.

I think you need to re-check what news groups you have selected :-)
I haven't had any porn sent to my email based on participation in this
news group.

I also don't use pre-view in my news or mail reader. If the title looks
even a little bogus I just delete it. I find that subjects that are all caps
usually can be deleted outright. I also use a large filter table, so certain
people and subjects get automatic deletion. Stuff like "help me" or
"MONEY" and "!!!" in the subject line get rid of about 50% of the crapola.

4089. APRS Transmission Interval Etiquette

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-27 01:55:26 UTC
From: <>
Message-ID: <8qrk2e$cc2$1@pyrite.mv.net>
Source record: 10815

Being new to APRS I would like not to make too many mistakes so I have another question. I have been experimenting with street level tracking using APRS+SA at my home qth and a TM-D700 in a vehicle. I live in mountainous terrain and the path from the mobile ranges from excellent on top of hills and mountains to nonexistent in low areas. In order to get as much detail as possible I have been keeping the auto beacon function on the D700 at 1 minute in rough terrain. My question is what is an appropriate transmission interval that will allow me to get decent tracking resolution but not waste bandwidth on the APRS system. Is there any established protocol like 1 transmission every X minutes or is it sort of a free form thing left up to the operator.

Thanks for the help on my previous question es 73

4090. Airmail/Winlink Pactor works GREAT!

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-27 02:01:09 UTC
From: Mike Pupeza <michael.pupeza@sympatico.ca>
Message-ID: <FxcA5.17086$vZ.879525@news20.bellglobal.com>
Source record: 10816

A while ago, I whined and moaned that my PacComm PacTOR controller became useless, since I was unable to check into the WinLink 2000 HF/Internet Gateways. The 'new' systems required Airmail Software, which didn't support my TNC. This put me off, especially since my unit was excluded, yet it conformed to the PTC-1 protocol, which was the backbone of ALL the later advancements.

I recently found that Jim (KE6RK) of the Aimail Software, HAD listened to me and patched his program to include the PTC-1 and PacComm PacTOR Controller into the useable drivers for his system.

I used his system for a recent 5 day camping trip and it worked GREAT!

I was able to keep in touch with my wife at home twice a day with no problems using the HF Xcvr (Why I would want to - that's another story!)

I was North of Parry Sound Ontario (250M N of Toronto) and regularly cleared my traffic with K4CJX and N0ZO, usually - although N8PGR and VE1(?) were also used.

Gang - this is a GOOD system.

Airmail2000
Winlink

Look them up, check them out, and use them.

I apologize for some of my previous venom! (However, if there are programmers who want to get Mac, Linux, Palmtops, etc., to work - you better offer to help!)

Ah.. right.

I remember looking at that some time ago, but kinda dismissed
it because I thought it required a modified linux kernel
(I usually stick to "stock" kernels due to extreme lazyness :)

I'll look over the code and see if I can learn some of the tricks
of the trade :)

4093. GPS + APRS Question.

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-28 00:00:00 UTC
From: Tobias Webster <webtron@thefreeinternet.co.uk>
Message-ID: <39d32cb1_4@news.bizonline.net>
Source record: 10833

Hello, I've been guided to this newsgroup for info on APRS.

What I want to do is set up a "marine distress locator" for my final year project.
Which will comprise of many GPS recievers and some method of sending there NMEA data out to my PC.
I found out about APRS but unsure how to incorporate it into this project.

Questions:

1) What does TNC stand for? I understand that it processes NMEA data into information packets.
2) Does a TNC actually transmit the packets ? If not what type of transmitter would I use and how much would it cost.
3) My PC will be used to pick up the APRS, but how? What device do I need? A radio????? What type, and how much will it cost? I have a AR8000 scanner could this be used????
4) Since my Degree is Software Design I will be writing a program to pick up the data recieved by the radio(if this is what is used) what format will this be in? NMEA or APRS?

Thanks for your time and please feel free to give any thoughts.

Regards
Tobias.

Tobias Webster <webtron@thefreeinternet.co.uk> wrote:
>1) What does TNC stand for? I understand that it processes NMEA data into
>information packets.

A TNC is a Terminal Node Controller, a device invented in the eighties
to use a dumb terminal to send packets. It is similar to what an X.25
guru would call a PAD. (Packet Assembler-Disassembler)

But today you don't really need a TNC, there are other simple devices
that are dedicated to the task of sending the NMEA data as a packet.

They are usually very simple PIC-based boards.

>2) Does a TNC actually transmit the packets ? If not what type of
>transmitter would I use and how much would it cost.

No, you need a separate transmitter.
First you need to look at your options w.r.t. licensing. Then you can
decide what frequency to use, how much power, what kind of antenna, etc.
(depending on the range)
This together will determine the cost.

>3) My PC will be used to pick up the APRS, but how? What device do I need? A
>radio????? What type, and how much will it cost? I have a AR8000 scanner
>could this be used????

You need a receiver matching your transmitter (the scanner will probably
be OK in most cases) and a soundcard or an AFSK modem or a TNC.

>4) Since my Degree is Software Design I will be writing a program to pick up
>the data recieved by the radio(if this is what is used) what format will
>this be in? NMEA or APRS?

This depends on what you send. You can send the NMEA data (this is one
allowed format of APRS data) or use the more compact APRS formats with
conversion between the GPS and transmitter (the PIC-based device will
do that, a TNC won't).
On the PC, it all depends on what you want to write. Plug and play
solutions are available (all the way from soundcard or modem to the display
of a map with moving icons), but you can always ignore part of that and
write your own software for that layer.
This can include DSP of the audio, decoding of the raw bits into packets,
decoding of the packets to relevant position information, and processing
of that information and displaying in the form you like.

Banners, commercials, and so on, not to mention the unmentionable stuff. (As if you didn't know)... The Ham bands are not an appropriate place for commercialism (and commercials) . Sorry to hear that after all your years as a Ham, you haven't figured that out yet.

>
> > Only a moronic LandLine Lid would have a problem understanding

Yes, I agree that promoting the use of Ham Radio for casual Internet access is total nonsense. You can get Internet access that is much less expensive, and that performs much, much better *without* trashing out the Ham bands. There is literally no point to it. Total nonsense, as you say.

transmit.

Most (but obviously not ALL) Hams are restrained by consideration of such concepts as common decency, and what's good for the hobby, not to mention the PART97 regs concerning commercialism in connection with Amateur Radio. Only a moronic LandLine Lid tries to find rationalizations for bypassing those considerations for trivial, selfish purposes such as the "total nonsense" idea of using Ham Radio for casual Internet access.

>
> > Get a CB radio, if you can't understand or abide common decency. Your

>
> One person's "common decency" is another person's "censorship".

Maybe YOU don't see a problem with porn on the Ham bands, but I think that by expressing that opinion, you have put yourself beyond the pale. Ham Radio should be safe for children, Hank. A place where they can go and EXPECT decency. Wake up and smell the coffee. There are other issues to consider here that are MUCH more important than misusing the Ham bands for selfish, trivial purposes.

Charles,

I've been on the internet since before it was the internet.

Anyone who thinks porn is rampant there is simply
going out of their way to look for it.

The internet has a large amount of useful information,
try it out sometime, you might be surprised!

4104. radio link between 2 PCs

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-28 00:00:00 UTC
From: LMalmeida@mail.pt
Message-ID: <8r0agm$mp3$1@nnrp1.deja.com>
Source record: 10844

Hello to all.
I would like to do a link between 2 PCs that are about 10 km apart. Wiring is out of question (to expensive). Now they are connect by a dialup connection (it only needs about 1h every day and the call is local). The connection doesn't need a lot of bandwith, but 9600bps is the minimum. A 50kbps would be great. I was thinking in something like a radio modem, preferably all in one box, no radio to buy apart. I had seen references to part 15 devices, what are those things (to someone that is in Portugal, that doesn't tell a lot), are the same thing that IEEE 802.11? And are capable of going all the 10 km (with some hills between).
References to hardware manufacturers would be nice, schemes of how to do would be great. The software of the terminals can be linux, dos or windows. TCP/IP is a must.
To say that the connection is only suitable if it's in the US$100-150 cost by point of the network (or the phone connections are still the best way to do it).
I seen that sometimes the answers in this ng became someting like flame wars, but remember that if you say RTFM, a location of the FM is a must. (BTW, is there a faq for the ng? the one I found was dated 22 Oct 93)
thanks
Luciano Almeida

PS. If you are seeing this message twice is because I posted twice. I couldn't see it outside my news server

The reason for the flame wars is that this newsgroup is about
amateur radio computer networking - not cheap substitutes for
leased lines or other facilities that cost money.

For your information, a Part 15 device is a low-powered radio
device that is not subject to licensing. Each country has
a similar description.

Part 15 radios still wouldn't do what you need to do.

One thing that might help get funding:
Design a Military or Government use as the 'main' reason for this
device/product
and then add a civilian 'ham' version of it. Backers will jump on the
Military Sales
potential bandwagon much faster than the mysterious (Unknown) Ham Radio
Market.
- Just a thought from a company that did JUST that for 10 years, before
selling the company for PROFIT. (We designed Aircraft simulator components
that also double with the right software as 'satellite antenna positioner'
controllers. Company name was ThrustMaster.

4109. radio link between 2 PCs

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-28 00:00:00 UTC
From: Luciano Almeida <lmalmeida@remove-me.netc.pt>
Message-ID: <8qvj4ucki1@venus.telepac.pt>
Source record: 10849

Hello to all.
I would like to do a link between 2 PCs that are about 10 km apart. Wiring is out of question (to expensive). Now they are connect by a dialup connection (it only needs about 1h every day and the call is local). The connection doesn't need a lot of bandwith, but 9600bps is the minimum. A 50kbps would be great. I was thinking in something like a radio modem, preferably all in one box, no radio to buy apart. I had seen references to part 15 devices, what are those things (to someone that is in Portugal, that doesn't tell a lot), are the same thing that IEEE 802.11? And are capable of going all the 10 km (with some hills between).
References to hardware manufacturers would be nice, schemes of how to do would be great. The software of the terminals can be linux, dos or windows. TCP/IP is a must.
To say that the connection is only suitable if it's in the US$100-150 cost by point of the network (or the phone connections are still the best way to do it).
I seen that sometimes the answers in this ng became someting like flame wars, but remember that if you say RTFM, a location of the FM is a must.
(BTW, is there a faq for the ng? the one I found was dated 22 Oct 93)
thanks
Luciano Almeida

Eh?

> Only a moronic LandLine Lid would have a problem understanding
> that, and go on to promote the use of Amateur Radio for casual Internet
> access.

Total nonesense.

> I don't think Ham Radio is going to die, but I do see where the "LandLine
> Lid" mentality will not last long in the hobby. As more and more Hams come
> to understand the fact that LandLine Lids are willing to toss the essential
> decency of Ham Radio for the most trivial and self-serving of purposes,
> being a "LandLine Lid" takes you further and further beyond the pale. -
> Exactly where you belong.

What any ham station transmits is the responsibility of it's control operator,
with the specific exception for cetain activies involving BBS systems.
i.e. it is up to the individual ham to decide what his radio should transmit.

> Get a CB radio, if you can't understand or abide common decency. Your kind
> has already had their way there. Go where you belong, with all your "good
> buddies". No rules! Go for it.

One person's "common decency" is another person's "censorship".

Apparently you don't know what "amateur radio" is. It isn't the use of
radio for purposes of any type of communication that would be more
expensive when using commercial providers. It is the use of radio by
people who want to experiment with electronics, propagation, etc. As
a hobby, where the communication is a by-product, not the goal.

So no matter if we have the right solution for you in the amateur radio
domain (which we really don't, but that is another matter), it would not be
usable for you as you would not be able to operate them within the
restrictions of amateur radio.

For cheap solutions, go to your computershop around the corner.
But I think they won't have anything as cheap as you want.

I'm often amazed with people who think radio links should be as cheap
as a $60 and have a bandwidth in the Mbps, and it will operate
through forests and mountains.

It will always be cheaper initially, to use a modem hooked-up to the
copper wire or cable that comes up to the house/office.

The cheapest system I can put together right now is about $500 a node
for new equipment. Maybe $400 if you have some old antennas from
the MDS TV system. But this will only go about 5 to 8 miles LOS.

But, if a cable modem costs $40 a month, or ISDN at $72 a month, you
can see where an RF link would pay for itself in less than a year.
Now the only problem, is finding an ISP within 5 miles of your link,
or putting up a 100 ft tower in the backyard :-)

It was amazing that one could transceive over RF too. Now that's
history. Perhaps we need more of THIS kind of "ignorance".

Isn't it all about breaking down road blocks? Where are you going
without a goal?

How about free, high bandwith wireless that also works over forests and
mountains! Isn't this the real challenge in Ham radio? Are we going to
continue to get stuck in our self-righteous letter of the law or are we
going to INNOVATE? Perhaps the lawmakers (FCC) better get ready for
change.

Sure FCC rules are important but mainly to stop the inconsiderate. Let
us not lose the bands altogether while bickering about the finer points
of Part 97 law.

>
> But, if a cable modem costs $40 a month, or ISDN at $72 a month, you
> can see where an RF link would pay for itself in less than a year.

Now you're thinking. No goal should fail to consider the cost
effectivness of a technological benefit. If it isn't adopted is isn't
used.

We need to ask ourselves what can airwaves do that coax can't.
We need to out-do or be happy working with wirelines.
We need bandwith in RF that can't be produced in coax or even fiber.
How? THAT is the challenge. That and the FCC. Dream big!

The amateur radio tcp/ip station located at Stanford University
(as of Sept. 1998) had radio/modem capable of sending over
50Kbaud over amateur radio. It may have been as high as 100 Kb,
with several people in the San Francisco area having similar
equipment.

I've been out of touch with them for a couple years... try finding
material on the Web on the Stanford U. amateur radio people; also,
one callsign i recall is n6oyu, though he did NOT himself have
the high-speed radio capability i am writing about here.

If i were living in the San Jose - Palo Alto - San Francisco
area right now and had the bucks to burn (over $500 for the radio
and $500 for the modem, they were saying), i would go for it.

Maybe other people reading this can help with this also. Also,
if it's for your personal, and not business or commercial use,
and doesn't violate other content restrictions, don't let anyone
tell you you can't do it on amateur radio.

Source record: 10714

sorry for asking...
So far what I have seen is all in the 1200 US$, both points. The ideia was to make the experiment. Not to save money (and a better letencies that in the internet). with the 200 bucks I can make about 400 h of comunications. but what was also important was doing something for myself. Also remember that cable modems and DSL aren't in all places. Where I live (ribamar, a small village in portugal, you may look in Encarta), DSL is a mirage and cable is only in major urban centers. The other node of the net wouldn't be an ISP (as I know, they don't have radio access to users). ISDN isn't a option (about $25+ the line plus the calls).
The call to the local computerstore also isn't valid, all i can find is home devices (2.4 ghz, most, and about 1/2 mile of range, at most, all about $300). As i know, the high range devices aren't available to the home user. The i had seen are to companies/ISP's that need to connect vital parts of bussines (and came with all the fuzz i can pass on, and a price tag that makes me angry, this without the no talk to a non pHD, nor bizz director of some multimillion dollar company).
I saw something in the range of amateur packet radio, i passed by the tapr.org site and saw some of the devices. what is stayed in my mind is that a radio is also needed. I WONDER if there is some company that make a radio coupled to one of the designs and put a TCP/IP protocol attached.
I'd also seen some projects that use proxim symphony cards or Orinoco http://www.xlan.org , http://www.gbonline.com/~multiplx/wireless/ and someones http://www.radio-link.net/link.html)and put a microwave antenna into it. Because i don't have LOS (almost, but not quite), I don't have confidance to place $300-400 in some cards and antennas that can became useless. Radio would be fine, because it matches my needs, is fast (about 300.000km/s), can travel trhou the hill and i don't need a megabit connection (56kbps is just great). Now what I didn't expected is to have to design a way to put the output of the modem to the phone line in the air (maybe some IF circuitry to put the about 10 kHz of the phone line is about 300-500 Mhz, remember to check what are the ones free here, the computer modem takes care of putting the computer connection in analog) and make the oposite thing in the other side of the carrier. Don't tell me that you were expecting me to go into university and need to share some works and do work with someone that is apart (without the need to pickup the car and spend fossil fuel, that now is almost $2 per liter here) from here to have this ideia (the packet radio is older than i am, some of you maybe are as old I expect to be someday).
And ISDN (here called RDIS), is known some interface between those boards and radio adapters?
I'd spoke.
Luciano Almeida

BTW, great page Steve.

You mean I can't tell someone I just got an email about "Hot Ladies"?
Of course I can tell them that.

Sure, but the original post, like so many in this newsgroup, had
nothing to do with amateur radio. It was a commercial posting:
"I'm too cheap to pay for a network and have some notion
that amateur radio may provide a cheap substitute". Which is
nonsense...

Sure you can - because it is neither the porno itself OR an advertisement
for the same.

Try to stay focused, and on-topic.

The porno AND the advertisements are all over the Internet, and have no
place on the Ham bands.

The morons who keep insisting on using Ham Radio for casual Internet access
are also the same morons who keep insisting the rules be changed to allow
everything you might find there. - Including advertisements the Internet is
chock-full of, including ads for porno. Commercial advertisements do not
belong on the Ham bands. Period.

Nobody ever suggested they be transmitted on ham radio.
It is trivial to avoid doing so.

Right. The internet is a terribly dangerous place! One must be ever vigilent
else one
might *open* an email that said "Hot Ladies" in it's subject! And then one
never
knows what one might find! Oh oh! Danger Will Robinson!

Is it really nonsense that people would feel that they could turn to Amateur Radio for answers to the original question? Is not Amateur Radio promoted as a public service? What better public service than to answer questions from the public about an area you are involved in? Perhaps Luciano assumed that some of the people in this group might be involved in the manufacture of commerical products, or, being knowledgeable about digital radio, might know about commercial products that would fit his need. Maybe he did, or didn't know, that Amateur Radio couldn't be used for his specific purpose, but I think it a natural to assume that a Service that promotes itself as knowledgeble and helpful would be a good place to get some knowledgeable answers. If he had any misunderstandings about the appropriate use of ham radio, I am sure he would have understood quickly once it was explained to him. If his interest extended past just getting the message across into an interest in things digital, it is entirely possible he might be interested in being a ham himself.

I am trying to follow the directions for installing Precision Mapping on WinAPRS.

The first step says to unzip PMAP_OCX.zip. I cannot locate this file in the winaprs directory or on the PM CD.

Where do you get this file?

Thanks

Thank you for your answer.
Maybe it's the answer that i was looking for since the beginning.
So far I decided to delay the link for a while. Phone line so far is working
and the connection only need about 1-2h daily.
Maybe sometime I will go for the radio solution (when i will have a real
job).
thanks again for your help.
btw, station 1 @ 39°00'20"N 9°24'16"W
station 2 @ 38°58'10"N 9°22'30"W
and, btw, i have some interest in ham. I'd been at a local fire department
(as volunteer) and i like the radio and comunications and all kind of stuff

4136. DSP-12 - a good P3D 400 Bd TLM receive modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-09-30 00:00:00 UTC
From: Bent Bagger <bentbagger@my-deja.com>
Message-ID: <8r4mf7ocr1@nnrp1.deja.com>
Source record: 10726

Now is the time to dust of that DSP-12 which is sitting on your shelf
and prepare for the upcoming launch of P3D, because here is some good
news for all you DSP-12 owners:

I have uploaded a modified version of the 400 Bd PSK modem for the
DSP-12 to the following URL:
ftp://ftp.tapr.org/dsp/Motorola/dsp56001/dsp-12.

The modification consists of a change to the software so that it sends
514 bytes rather than 512 to the listening program. In this way also the
CRC bytes will get transmitted to the listening program.

The modified modem has been tested by Stacey Mills, W4SM, and he has
this to say about the modem:

"I burned the new eproms and checked out the 400 baud PSK demodulator
with 514 byte capacity. It works very well... Actually, very, very
well. In fact, doing some tests with some 400 baud PSK wave files that
I have generated, having a calibrated background noise, the DSP-12
functioned as well or better than any other modem I have tested"

The file gce201.zip contains these files:

READ.ME
GCE.V40 - Executable that may be downloaded to the DSP-12
GCE.B - PROM image for the B-PROM. Checksum: $1900
GCE.D - PROM image for the D-PROM. Checksum: $5000
GCE.F - PROM image for the F-PROM. Checksum: $4900

Have fun.

Ooh, I'm interested in this. Is there, like, a standard program
that people use to do this kind of thing? Can you get the data
for free, and what kind of work is required to do this. That is for me
to figure out whether two points on the map are line of site, without
leaving
my computer desk here. Is there a web site or book that describes
how to do this?

DTV is the system this country will be using exclusively by 2006. Many stations
have already started transmitting it. This is the over the air example of MPEG
compressed live digital video that we have available as a model. As such,
understanding its parameters and limitations is relevant to the current discussion
of amateur digital TV transmission.

>> Compressing it with MPEG and then modulating it 8VSB can fit it

>I disagree. Mpeg is compressable and expandable by an intel cpu. Now I know
>that mpeg is simpler to expand than to compress, but 400 mhz chips can
>expand quite well, and we are headed north of 1ghz.

You can't do it on a PC because the data rates are much too high to be
handled by a PC. Even with SDTV, we're talking about 300 Mbits per second
in the raw video stream. The compression algorithms require *much* more
than a single clock cycle to execute, so a 400 MHz PC is much too slow,
even the soon to ship 1 GHz CPUs are too slow, not to mention that the bus

speeds of PCs are too slow to keep the data streaming in and out of the PC
without bottlenecking. The commercial Harris MPEG encoder we use has
a massively parallel architecture using custom bit slice chips to handle it.
It occupies half of a 6 foot relay rack and requires 20 amps at 220 VAC for
power. That's the state of the art today for MPEG compressed live video.
(It actually runs one full frame behind realtime.)

Decoding MPEG is a much easier task, but the PC still can't handle a
full rate SDTV signal. It takes a custom chipset to do it. The PC can
decode a sharply rate reduced signal, but that isn't full TV resolution,
size, or frame rate.

>I'll let the 100,000 thing you said stand, but no, I don't personally
>beleive that either. Mpeg 1 and mpeg 2 chipsets exist, and are being

>studio equipment.

I'm talking about standard live action full motion full resolution video
of the sort we've been delivering to the home for 50 years using analog
NTSC broadcasts. Now if you are talking about sharply reduced rate video
that's post-processed out of realtime, then that's a different story. Strongly
rate reduced video can be MPEG compressed on a PC, not in realtime, but
at a multiple that's only about 10:1 behind realtime. For preproduced video
segments, that's tenable, but it isn't live TV. We do that too in broadcast.
We can post-process 30 seconds of video in 5 minutes using a normal PC
architecture. That's fine for commercials and other short segments that
we can prepare in advance. But we can't do that for realtime live video
with a PC.

>avialable software.

We can fit an analog SSTV signal into a SSB bandwidth today. In fact it
is done every day over the air on 14.230 MHz. We could do it digitally in
a FM voice channel bandwidth today too. In fact we do that, transmitting

digital pictures by packet. Doing it at 8 seconds per video frame on the current low speed packet links is another story, of course.

Even MPEG compressed, there's a lot more data bandwidth required than when transmitting the picture in analog form. It takes a minimum of 8 bits per sample to convey the luminance information in a single analog video level, and you have to repeat that for every sample of the video line that you send. With standard TV resolution of 640x480, and a frame rate of 60 per second, that's 145.7 Mbit/sec. For slowscan we reduce that to 120x120 and a frame rate of 1 per 8 seconds, so we only have 14,400 bits/sec. But that's only for B&W pictures, if you want color, you have to multiply everything by 3.

Depending on picture content and motion, MPEG can reduce that by a factor of between 2 and 4 (more if you'll allow some fairly gross artifacts due to lossy compression, you've seen those artifacts if you've watched streaming video over a dial up internet connection). But you're still talking a substantial signal bandwidth. There's no significant over the air bandwidth savings with binary modulations. With multilevel modulations, like 8VSB, we can shrink the signal down to about what we would need to transmit analog video signals. We can't do that through an ordinary FM voice radio, though. We'd need a purpose designed RF modem.

Remember that we can't use the bandwidth compression tricks used by phone line modems over the air. The nature of the medium is different, and those techniques don't work. We have a multipath riddled channel, often with a marginal SNR, laden with interference and contention that the phone line methods don't have to face. So we have to use more robust modulations, and those occupy a greater bandwidth, or take longer to transmit.

There are advantages to transmitting video digitally. Otherwise we wouldn't be spending better than $50 million per broadcast station to convert over to do it. But you aren't going to get full resolution full motion video in bandwidths that would be acceptable for use at amateur frequencies below 70 cm. Most amateurs are unlikely to expend the necessary funds and efforts to do DTV on 70 cm when they can already do analog TV there with simple equipment.

SSTV may be another matter. The digital advantages against noise and interference may be sufficient to cause amateurs to make an effort in that direction. But MPEG compression is hardly needed for slow scan. The data rates are already low enough to be used on ordinary radio channels, and the pictures are already so crude that further artifacts due to compression would likely make them unacceptable.

You can do what you want, but not for that price. The best deal I've
seen is the Surfnet frequency hopping modems at $300 each. This
is a complete turnkey package. You'd need 3, one at each end of the
link, and a third to act as a relay node at a point mutually visible to
the others. I know from experience that these modems can achieve
a 28 mile line of sight range, though they only claim a 5 km range.
But they won't work very well over an obstructed path. You will have
to engineer the path to be line of sight by installing a mutually visible
relay node.

I know that's more than you wanted to spend, but these modems
do 115 kb bidirectional, and don't require a license to operate.

You ignored the comment about handheld digital camcorders...
Sure the quality is less than broadcast standard, but they aren't that bad
either. They are *a lot* better than anything I have seen done in software
on a PC, for sure.
How are these beasties ticking? The compress in realtime for sure, the
recorder would not be able to store the live video without compressing it
first (due to the bitrate limitation you mention).

Icom IC-737 Mint Condition.

If your the winning bidder, you will receive a beautiful General Coverage Rig, Mint cosmetically as well as electronically. Built-In Antenna Tuner, No Microphone. I do have a COPY of the owner's manual.

I try to personally check out each item I list for auction, and to describe each item completely & carefully. However, since most of these items are used electronic pieces all items are sold "AS-IS".

BUYER pays a flat rate of $30.00 for shipping insurance and handling.

This rig was checked out by a local LICENSED HAM TECHNICIAN in North Georgia, and found to be in EXCELLENT HEALTH (this was less than 3 months ago).

THIS HF RIG IS A RELISTING!! I LOWERED THE ORIGINAL RESERVE PRICE. With the RESERVE lowered to it's current price I am now cutting the rig over $500.00 from what I paid for the rig less than 3 years ago!

ADDED BONUS!! To the HIGH BIDDER & (who meets my reserve price)I am giving FREE a cable that connects the RIG to a IBM Compatible PC. You can "Control" The IC-737 via your computer!! This WAS NOT Included in the orginal offering.

To Bid On This Item, Please Click Here!
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=454010399

Please contact me for any further information ngwd@flash.net

Happy Bidding Good Luck! 73 Daniel KC4OXP

> sorry for asking...
> So far what I have seen is all in the 1200 US$, both points

To do 56Kbps, in the environment you describe, that's about right. A VHF WA4DSY/transverter setup at about $700/site(including shipping to Portugal) would probably work in your situation.

But to be sure, I'd have to see the hills and the two sights to tell you if it would work. Here in the USA we have topograhic maps that can be used to do a sight-unseen analysis, as well. Even Worldwide Level 0 DTED(freely available for downloading on the Internet) can sometimes be of some use. If you give me the precise lat/longs of the two stations, I could give it a look.

If you are willing to drop down to 19200 or 9600bps, AND the terrain allows a UHF link, you might be able to get the costs down to about $600 total - two TEKK data radios(about $190/ea), UHF directional antennas($100/ea), and some YAM 9k6 modem kits($20/ea). Getting your antennas/radios up on a tower can help to greatly extend your range on UHF - but of course the costs begin to climb again - and if you can't get your radio mounted on the tower, your transmission line costs start to really add up on UHF(you need to use high-quality low-loss coax at these frequencies) - so you are starting to look at $1200 again, if you have to battle to acheive RF LOS! If you need more power than the TEKKS put out - you can go to Kantronics D4-10 10W UHF radios - but now your possibly looking at up to $1700!

So, you see, this is why we just end up flaming each other here - hardly anybody here is in a situation where he/she needs to set up a station like you describe(I actually am - I'm working on setting up a link from San Diego to Rosarito, MX - thru rolling 150' hills, over 25 miles). And for those who do want a setup like you describe - they can't afford the time and/or expense to do it.

It is VERY cheap and easy to do 50 mile VHF radio links at 1200bps - the problem is that is TOO SLOW to do most modern applications. APRS is an exception. Cheap access to E-mail/newsgroups/chat/stock quotes/etc. from a mobile laptop/PDA might be another - but then you would run into the hams that would protest even this.... That is why I'm eventually going to be moving my 1200bps mobile applications to MURS (a new VHF radio service in the US that allows both digital and commercial content).

Oh, and I tend to agree with the "Helpfull" and "O.C."'s attitude. If you're not interfering with anybody else - just go ahead and use the ham frequencies to set up personal low-cost high-speed RF Internet access links - the FCC gives us no other choice(MURS won't work at more than 1200bps, as there aren't any companies making VHF 9k6 data radios). Save for a few high-profile repeaters, the VHF/UHF ham frequencies are basically unused. If enough hams start doing it, the FCC will probably just change the rules to allow it, or start another service that will allow it. The public are being FOOLS for paying huge initial equipment costs, and $40/month for wireless Internet service.

So are dollars - which is why I cannot get a fast packet modem at present.
The kits sell for around $270US (not including the relevant transverters).
This would be just feasable for me if it was Australian dollars but since
the US is the only country doing well in the world our dollar has dropped so
these modems would cost about $500 Australian.

4156. Universal FSK Decoder Software?

I am only responding to this post to point out that above (drug
induced) so called logic is misleading as follows.

You might say an airplane can't fly because the laws of gravity or
physics will not allow it. This was the belief. Not to mention the
sound barrier. Now these amazing feats would appear as magic and
unbeleivable to our nay saying forfathers. Yet those who innovate with
God given creativity have worked with laws of physics to overcome.

So where is innovation in radio that would solve our problem and provide needed benefits?

"Nesesity is the mother of invention"

Edision failed repeatedly until he'd invented the Light Bulb. It is interesting to note (now that I consider it) this too had to account for practicality, logevity and cost effectivness.

Never give up on a good goal! (That's by me) :)

73

P.S. First we must define the problem. What are the needed benefits wirless RF could provide if there were no limits?

This was 2 years ago. Stanford had it, and the folks i was
talking to in the San Jose and east-bay areas were going to
get set up for it. They (and the jnos mailing list inhabitants)
were very very helpful in getting me set up in 1997. Some of
them probably frequent this newsgroup.

You ass needs a good spanking little one. When you can't argue a point then put them down for spelling errors then right? This kind of perfectionism we don't need. Stop filling the groups with YOUR spam that's off topic.

My point was; our innovative forefathers didn't put up with this nay-saying crap and neither should we. If you're not for innovation you're against it.

Look Charlie! Put down the broken beer bottle and shut the hell up. You are obviosly stupid or you wouldn't have you real name posted is hear. Your one sided neanderthal thinking isn't helping anyone.

My point is that wanting to change, enhance, ungrade and or fix the FCC regs is NOT the same as disregaurd for them. I'm not talking about the kind of childish repeater interference that you probably do yourself. I'm talking about new tecnologies and REAL benefits. I do NOT condone breaking the law. Open your eyes.

Your kind says they want to keep the ham bands from being sold off but in truth you are a kin to CB'ers trying to commander the band for your own special interest! What's more your know-it-all fat headed swill is getting old. I don't care what you've accomplished technically if your going to be an ass. This is a lesson that all Hams best consider or we will stagnate or die until the old gaurd dies off. I'm not that young and so I personally don't care to wait for the foolishness to stop. Just cease and stop being a big baby!

Hugs and kisses

The Tekk radios can do 19.2kb if you replace the stock IF filters (at 21.4MHz) with wider ones. PacComm in Florida sells a version that already has the mod, or can provide the parts if you want to do it yourself. I'm not aware of the Tekks being modified to run faster than that, though.

Well, I didn't think you were serious. Now that I see you really
are serious, I will only say that you are right and I am wrong.

I wish you the best success in designing new laws of physics
to do what you would like. I know that someone will eventually
find a way for microwaves to go through mountains, and for
forests to have 0 dB of attenuation. It may even be yourself!

"He ain't no man, he ain't no god, I don't wanna walk the path 'Bob' trod."

Now at http://www.subgenius.com.

You're right. Ham radio newsgroups are traditionally slackless. I accept it as "cleansing the palate." A notable exception is the antenna group, agitated by the fractenna character (s?). Not really a troll, I believe fractenna is a rare channeling MetaTroll, oblivious to his own nature, staying 110% in character and causing some of the funniest flamefests I've seen this side of news:rec.sports.football.college .

Gratuitous on-topic material follows: Bought a Hustler 5/8 over 1/4 collinear 2-meter vertical antenna with tiny radial spokes at the local ham club el-cheapo auction last week. Turns out it also loads up on 10 meters. Worked France and Spain right off the bat this morning on psk31 with the darn thing. 40 watts.

Have you set up the sampling rate under the network options (I think
that's where it is)? Without that, there is no sampling by the sound
card while you still hear audio.

I found that a call to the FCC's enforcement division put a fast stop to
illegal activity in the north Texas packet network. If you see any of these
morons willfully breaking the regs, give the FCC a call. They will rapidly
discover a new respect for the regs, and their fellow Hams.

Source record: 10664

Over the past few years many hams have experimented with the DSP 56002 EVM from Motorola. This board is now obsolete; so where do we go from here? I'm doing some desk research into what alternatives exist in order to establish the best way to move ahead. If you feel you can contribute, I would be very grateful.

Have you explored any of the later Motorola EVMs such as the 56009?

Were they compatible?

Were there any problems porting code from the 56002?

Have you tried any other DSP modules instead?

Please either respond here, or email me as mailto:gareth@g6kvk.demon.co.uk. (don't email my NTLWORLD account)

The RigBlaster is not involved in receiving, only tranmitting. If you don't have a waterfall, you probably don't have enough audio signal coming from your radio to the input of the soundcard. Sometimes you have to use the speaker output on the radio and/or microphone input on the soundcard to get enough signal. On my IC-736, I take the audio from the accessory jack on the back, but then have to use the microphone input on the SoundBlaster to get enough signal. Make sure whichever input/output combination you are using, you have the corresponding input on the soundcard not muted and at a sufficient level.

Yes, same suggestion here. The IMPORTANT thing in my case was that there are many mixer controls on the average soundcard and you have to make sure that the right ones are turned up. Yes, it often requires multiple controls to be turned up. On the volume control applet, make sure that you have the properties set so that you see all of the controls, and that all of the controls are turned all the way up.

I'm not familiar with the 1270C, but as I recall the 1270 was pretty much identical to the TNC-2 (it was licensed by TAPR, not really a knockoff) with a different form factor. I don't know if it had some of the mods which were recommended, like removing the MF-10 filter.

The 1270B has that filter removed and also has provision for switching between 1200 and 300 baud. There was also a 1274 which was identical, except for the addition of an LED tuning indicator for HF.

At some point MFJ increased the amount of SRAM from 16K to 32K in the 1270B (required by later firmware).

Under properties in the Volume control, you have to select a window for "record" which is recieve and for Playback, which is transmit.

The input you use should be ON in record and OFF in play back.

I also use the Mic in for my set up HOWEVER there is DC on the mic jack which you should block from your rig using a capacitor or a transformer, or both. (I use a 10Uf capacitor). The dc on the signal WILL distort the recieive signal if not blocked, and in the case of my rig, that dc got back into the audio ckts of the rig and caused improper squelch operation!

When they are ridiculous laws - of course. The National 55mph speed
limit WAS a ridiculous law. Whole States disobeyed it. Eventually it
was overturned.

> > > Afraid that you are trying to preach to the wrong choir here.
> >
> > Bullpucky. Drop the "holier-than-thou" routine.
>
> You call W5YR a lawbreaker?

The 55mph speed limit is not really that much of a law. If you were
caught surpassing it(within moderation), you were guilty of
an "infraction". You were NOT put in jail(as long as you paid your
fine).

I view the perceived "content restrictions" on Amateur Internet access
in much the same light. There are no clear cut rules. Hams sell ham
gear all the time using amateur frequencies, and many even make a small
living at it - that is somehow OK. As long as "blabbermouths" didn't
go complaining to the FCC - we could also have free wireless access to
the Internet. While anal-retentive spoil-sports have helped to
restrict growth up to this point - it has really been the lack of
applications that have stopped the growth of Internet-backboned packet
systems. Now, with the increasing capabilities and dropping prices of
PDAs - a new applications arena is beckoning(it might not involve Web
access, but portable e-mail, chat, newsgroups, and stock quotes are
VERY doable applications at 9600bps - even 1200bps). I say just try to

ignore the spoil-sports, as they putter along in the slow lane at 55mph - blocking-up traffic. Besides, if they put up too much of a stink, we can always just use MURS!

So which is happening? Are you putting out 100 watts or no RF output?

And what did you do to fix your receive problems?

It certainly helps if you provide detailed descriptions of what your
problems are.

I purchased a Rigblaster to try my hand at PSK31, and connected the jumpers and wires just the way the website had posted. (I have a Kachina) I get a pwr and a digital light. The PTT switch makes the digital light go away. However, no matter which PSK31 program I try, I cannot get any receive signal, although I can hear one through my headphones. I can test transmit as well. I haven't gotten an answer back from the rigblaster folks. I tried to set up the receive just like the manual said but I think I am missing something important. Any help??
Thank you -

Hmmm... How much does the monthly service cost? What frequencies does
it operate on?

I'm working on a PUBLIC Internet-backboned system that will operate on
MURS frequencies, uses existing PDAs, and will be VERY low-priced.

> Hmmm... How much does the monthly service cost?

This is not clear from the web site.

> What frequencies does it operate on?

900MHz device! Seems to run at 19200bps. I just found out that this
kind of thing apparently is very popular in Japan. I had this kind of
idea about two months ago, and have started a company(PubCel), and have
been working on apps.

> I'm working on a PUBLIC Internet-backboned system that will operate on
> MURS frequencies, uses existing PDAs, and will be VERY low-priced.

I'm working on 9600bps applications on MURS VHF frequencies. The
communications range should be MUCH higher on VHF. With 900Mhz UHF,
you are very limited. Also, you can't do anything with the antenna to
increase range. With MURS, we should be able to.

Note: TAPR is trying to do their radio on 900Mhz too!

Note: This device has a more restricted screen size than the $149 Palm
MP100 160x100 vs. 160x160. Also, it has very little RAM 512K vs.
4Mb. However, it is cool that it has built-in RF capability. The kids
are going to like being able to communicate with each other in class -
I've got two teenagers, and this is what gave me the idea. But look at
the range; 150ft indoor - 300ft outdoor. What a joke. I bet those are
lab numbers, and you won't even get that(same with the TAPR FHSS
project!). I need to take my company public.

And a nice Bronx cheer to all you old PBBS nincompoops who didn't see
this coming. Try loosening up the old sphincters a little bit, and

quit threating to "report" anyone doing Internet-backbone applications on ham freqs. These applications on these device are mostly e-mail, chat, and games, anyway. With cheap 19200bps capable TEKK radios, there is NO REASON why we can compete here, AND bring TONS of kids into the hobby at the same time.

While the "restrictive" attitude of some hams has restricted growth of Internet-backboned digital comms on the ham freqs, the real factor has been a lack of modern applications for low-moderate speed packet(1200-19200bps) - APRS being the exception. Now that PDAs are more capable, low/moderate speed packet has an opportunity to make a comeback. The difference this time will be that the backbone will be the Internet, instead of the kooky HF-forwarding PBBS forwarding system of the late 80's and early 90's(which functioned very much like a Internet newsgroup, but much slower, and much less reliably!). Do you know who the BIGGEST opponents of Internet-backboned systems are? Why, none other than a group of aging PBBS HF message forwarding system operators. These "spoil-sports" are still bitter that they can't "play GOD" anymore with the PBBS system. I haven't figured out their reasoning for opposing Internet-backboned systems so vehemately. I suppose it is to show that they were "good Gods", and that we should return to the "golden" days of HF message forwarding - which mainly was a forum for selling old ham gear, and supporting high-speed Morse Code requirements(due to the "slanted" view of "the Gods").

no monthly fee, as the units only communicate with each other. If you have two you can connect one to your internet PC and use it as a gateway so you can run email and ICQ from another portable unit.

<horseshoestew@my-deja.com> wrote

> I need to take my company public.

No.

You need venture capital. To get that, you need a physical
business plan. The vc guys will take you public when they
are sure they will make a killing, and not one minute before.

Until then, you will have ample capital to both hire engineers
and ramp-up a production base. This means a post-prototype
device void of any patent infringement. They will usually
hire a patent lawyer to check the fees, and finish out the
business plan.

You need to find an economically depressed area to build
the factory, as the city will be eligible for federal funds,
and you will get zero property taxes for about 8 years.

Another good idea is to hire a full-blooded Indian woman
to be the President, or at least an Hispanic woman, and
this will be the only way to get a small-business loan.
Indian women, make excellent executives and will be
one of your best investments for the company.

Jimmy

P.S. You will normally have less than 51% ownership by
the time you have all the capital you need.

Thank you for the replies - got the sound card problem taken care of and now I have the waterfall, but when I try to transmit, it doesn't key the xmitter in VOX, and if I put it in AUTO, it keys all the time, with no rf output. Followed the directions in manual, but still nothing. Wondering if the jumper diagram is correct. Cant seem to even get heard on voice - but the rig meters say that I am putting out 100 watts. Maybe the bands are dead - I can only hear east coast stations on 20 meters. Any other suggestions - So far, PSK31 is really great, but I want to do more than copy the mail.....

If you are allowing messages and content that do not meet the criteria
(As set by the FCC) for legal traffic, you are illegal.
If you are providing a service to others which is also available through
commercial providers, you are illegal.
If you encrypt your data, you are illegal.

You really need to READ part 97, and read it for content. The rules are
in place for a reason. That reason is to keep guys like you from using
the ham bands for commercial ventures.

I have nothing against the technology that you are proposing, provided
it be used on a frequency band that is approved for that type of
traffic.

Dave

The reason I only post infrequently on these newsgroups is the same one that is causing our great hobby to die out. I have been a ham for 17 years, and during that time I met many great people, but unfortunately, it is the "mouthy minority" who insist on putting in their uninformed opinions that makes us all look bad. Seek professional help. Find out why you think that "rolling your own" makes you superior, knowledgeable, or even qualified to make your statement. I spent many an hour making other ham's "roll your own" equipment operate. This does not make them stupid, as you infer that I am. If you haven't got anything constructive to say, then don't say anything. I asked for help - not snide remarks. Get a life.

>I don't think so.

I don't suggest that his area of interest is somehow wrong, I only agree
with the advice that he should invite someone with more insight in this
matter to fix it for him. I don't understand how this can be considered
bad advice.

Once you have studied a simple schematic for keying a transmitter, and have
soldered the few parts together, you usually know enough about it to know
the limitations of the design, and what to do when the transmitter does not
key or remains keyed all the time.

Same for the connection of soundcard output to a transmitter.

When someone considers it easier to buy a blackbox to perform these tasks
and does not understand why it does not work, it is very difficult to
diagnose the situation from a remote location and provide him with advise
that would help him towards a working station. Someone should do some
simple conductivity and level tests at his station, and deduce what is
wrong.

More doublespeak. The rules are in place to disallow an individual to conduct business on the ham bands. There are plenty of "commercial" ventures on the ham bands - what do you think APRS is? What do you think all those commercial radios are? You're talking out your ass.

> I have nothing against the technology that you are proposing, provided
> it be used on a frequency band that is approved for that type of
> traffic.

It IS OK for ham bands - because there ARE no other commercial services that offer the same kind of functionality(there are no existing services that provide equivalent range for mobile platforms). Besides, if your reasoning held true - we would have to outlaw all ham phone patches! Quit talking out your ass.

Now *I'm* baffled: how can you be a ham for 17 years and have
such difficulty figuring out these interconnections? Are the
makers of the hardware or software doing something wrong?
How can they do it better?

Simple - The supplied manual has a pinout that differs from my rig. The version 2 manual on the supplied software shows a second, and the website shows a third version. None of them seem to work. At first my soundcard input connector was bad (I fixed it, so now I have a spare). Following the manual doesn't produce any positive results, therefore I am inquiring if I am mis-reading the manual. I have received a response from Rigblaster and they are baffled as well. I was hoping to find someone who has encountered this problem and would offer a solution. I have received a few great responses, and they were greatly appreciated.

I'm doing it right now - call the FCC. If you keep bothering them with
non-issues, they'll probably pull YOUR ticket for being such a pest.
As long as you aren't conducting business over the Amateur frequencies,
and are using the channel for personal communications - it is legal.
Quit spreading false rumors - you aren't "God" anymore.

I checked out their site thoroughly. The problem is the range(or lack of it). I've thought about getting a couple for my kids, and so I can get ideas - but the range looks so sickly that it reminds me of those old pre-FRS 49Mhz "walkie-talkies" that you couldn't talk to with anyone 100 yards away outside, or in the next room! This kind of thing could make it harder to sell more capable wireless PDAs in the future, if people get the idea that the technology is bunk. This was an initial problem with FRS(and still may be a problem to this day), as people were hesitant to get "ripped off" with cheap walkie-talkies "once again". To be honest with you - FRS range STILL sucks - but 1 mile is much better than 100yards.

You talked about development - at the site it just says "coming soon". This just amounts to marketing hype at this point. I've been working on Palm PDA apps, got sick-and-tired of the GCC runaround, and now I'm running CodeWarrior. At least this is a "real" development environment, and not vaporware.

First:

Go down to Radio Shack and buy a multi-meter. In 17 years you
should have acquired one by now. With this device, no pin-out
or audio output is beyond your capability to map and decode, or
calibrate. Volt's and Ohm's are simple to learn.

Second:

You're going to have to have another ham report on your PSK
signal, as it will be easy to overdrive. Measure the audio level
for a future reference. An O'scope is better, look for one.

Our government doesn't either. In fact they cash in large amounts of
money from the companies operating these services, for the spectrum
they operate in.

I'm curious about several things:

Don't you have local resources you can draw on? Doing stuff like
this over the Internet seems a pain, though people insist on doing
it anyway.

Why do so many hams draw a blank when they interface sound cards
to radios, anyway? It's just wires.

What ever happened to troubleshooting? If it doesn't work perfectly
when first plugged in, people seem to give up these days...

When I read Stew's proposal to sink money into selling wireless toys, it made me think just how far ahead the GSM world already is in terms of deployment and maturity. Stew - save your money, or, better yet, invest it in one of the real wireless companies.

The wireless telcos realize the money to be made, and they're happy to make it one penny at a time.

Stew, have you read GSM 07.05 and 03.40 ? Considering your zeal for blurring the lines between amateur radio and other radio services, I'm surprised you're not all over this.

Non-sequitor. Our wireless carriers are happy to subsidize the phones
and sell the service rather cheaply. Here in Northern California, my GSM
service plan includes 500 peak minutes, 1000 off-peak, free roaming in
CA and NV, free domestic long-distance and 300 free SMS messages, for
about $60/month. Oh, can't forget voice mail, and bidirectional email-SMS
capability and caller-ID.

Especially on weekends, my POTS lines see few outgoing telephone calls.

There are family calling plans now that make family radios look silly for
anything but camping in the backwoods where there is no coverage.

Socialism has nothing to do with it - this is capitalism, hard and fast.
The fact is, even in Europe it's capitalism.

Then why aren't you checking the pinout as printed in the manual of your
rig? Often it is printed in two places: one time in the general section
where it shows how you can connect your own stuff, and one time in the
schematic, where you can trace leads and derive their functionality.

One can assume that these pinouts are correct, the worst problem can be
that you don't know for sure if it is a view of the outside of the rig or
the front side of the plug. But often there are pin numbers.

Are these "walkie talkie" things still popular in the states? Guys, you
are years behind! Over here in Europe all the schoolkids have a handheld
phone (GSM) and are sending short text messages to eachother when in places
where it is not clever to talk in the thing.

No range limitation, you can chat to your buddy whenever both of you are in
range of the mobile network. Which should be anytime, given the fact that
antenna forests are on each of the highest buildings of every block.

(some statistics show that there are more handhelds in this country than
there are private subscriber phonelines)

They don't seem to have a monthly service as such. The Cybiko seems to be a pure peer-to-peer system with the functionality of a PDA. The company does offer games and downloads for the device.

If you read the brochure, it is careful to say (in kids' language) that it can support 100 users (10 users per freq for 10 freqs.) There is supposed to be an email gateway available, though it is strictly local (basically, a Cybiko hooked to a PC with the software). Nothing said about cost (if Cybiko provides it) or security. They do say the gateway software will be available "soon" for regular users.

Thanks for reading my post. IF the HF doesn't bring my reserve, it will not be offered anytime soon.

If your the winning bidder, you will receive a beautiful General Coverage Rig, Mint cosmetically as well as electronically. Built-In Antenna Tuner, No Microphone. I do have a COPY of the owner's manual.

I try to personally check out each item I list for auction, and to describe each item completely & carefully. However, since most of these items are used electronic pieces all items are sold "AS-IS".

BUYER pays a flat rate of $30.00 for shipping insurance and handling.

This rig was checked out by a local LICENSED HAM TECHNICIAN in North Georgia, and found to be in EXCELLENT HEALTH (this was less than 3 months ago).

THIS HF RIG IS A RELISTING!! I LOWERED THE ORIGINAL RESERVE PRICE. With the RESERVE lowered to it's current price I am now cutting the rig over $500.00 from what I paid for the rig less than 3 years ago!

ADDED BONUS!! To the HIGH BIDDER & (who meets my reserve price)I am giving FREE a cable that connects the RIG to a IBM Compatible PC. You can "Control" The IC-737 via your computer!! This WAS NOT Included in the orginal offering.

To Bid On This Item, Please Click Here!
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=454010399

Please contact me for any further information ngwd@flash.net

Happy Bidding Good Luck! 73 Daniel KC4OXP

>YEARS!

Apparently some of you people from the USA seem to think that the entire world outside of their country is socialist, and the governments of all those countries are "giving away" services to their inhabitants.

This is not the truth. The companies operating the mobile phone system over here (and in most other countries) are fully commercial operations, and are operating on frequencies that they bought during an auction just like that. In fact, most are already operating on 1800 MHz as the 900 MHz band you mention was already completely used several years ago.

Unfortunately, European consumers are now suffering from the "European Community" problem, where all the companies in the European countries think they will be better off when they operate in another country than their original home country, and end up fighting over the scarce spectrum space during those auctions.

So, everyone ends up paying way too much, and the only way to recover those costs is by letting the consumer pay more. They can only hope to get something back via their governments (who received the money and are supposedly doing something for the country with it). But in the case of the Netherlands, the parties came to agreement pretty quickly and the total sum was way less than expected. In Germany, our neighboring country, the reverse happened and everyone paid WAY too much. Now, some of the parties involved in that mishap are also active in the Netherlands and so our customers will end up paying without any chance of getting any returns...

In fact one can be surprised that a country like the USA, which is supposed to be capitalist, is using this auction system. It will bring money from the consumer to the government, which you people are so eager to claim is a socialist system.

I do not know of any others that 'do it all' but you can find most FSK
modes covered by free or inexpensive software. Which modes were you
interested in?
PSK has dozens of free packages.
RTTY / AMTOR works very well with TrueTTY (DXSOFT.COM)
SSTV / FAX ... search the web, a number of good freebies for sound card
are out there.
Others modes are available too but you'll need to search for them.
The other way to go is to buy an all mode TNC (PK-232 etc.), they
usually come with the software, cover most modes and are available used
for a decent price!
....
Please... if you do find an inexpensive all mode sound card decoder
please POST it here.... I, and others, would be interested.

With a deficit of 5 Trillion, we have to be creative in ways of manufacturing
more money, to pay for the programs our representatives think we need.

There's a distinction that should be made here -- Europe
is "socialist" in the sense of social engineering: high
taxes going to support a welfare state; belief that the
government needs to intervene in peoples' lives because
the individual is society's responsibility; things like that.

It doesn't mean that capitalism is extinct in Europe.

As i see it, if a GOVERNMENT were to subsidize the phones
(in Europe telecommunications are mostly government-owned,
right?) that would be a socialistic practice, but if a carrier
subsidizes the phones, that is NOT socialism as it is
commonly defined.

Whoever is doing the subsidizing, tho, is engaging in some
kind of social engineering: trying to get people to do
certain things, live in certain kinds of ways. Some of us
think it's better for the engineering to be decentralized,
rather than all in the hands of one monolithic organization
(like the government).

So if a ham radio packet-internet gateway provides e-mail
service to the radio-side users, it's illegal because they
could get that service from a commercial provider? I don't
think so. In 1997-98 i was doing just this, and was in
communication with dozens of other hams doing it as well.
Where are you getting the fuel for this allegation?

Hi to all !

I want to try with 9k6 packet radio (until now I have played well with
1k2), and don't know
what radio to use . Now I can choose between :
kenwood tmg-707 , which as a built-in 9k6 data port , or
standard c-528 , for which are available a lots of mods ...

Any advice?

I'm just a stundent, so don't want to throw away my money ....

No, telecoms are no longer government-owned. We now have the same
mess as in the USA. Even worse, when mobile telephony is concerned.

To remain alive, operators have to give away phones. In fact, the
government doesn't like this practice.

The two parties running for administration are pissing all over themselves
on how to spend the annual surplus. My math says you don't have any
surplus until you repay the loan.

Our deficit represents about $14,000 for every man, woman, and child
in the U.S. (plus or minus the Federal Reserve Interest Rate).

We are hoping that foreign workers will come here and pay taxes too!

Going through USCFR 47 part 97, I can't find just what you're referring to
here. Using the same logic, using an autopatch is illegal because one can use
a cell phone too.

Yes - the USA is years behind Europe and Japan in this area, and
is "stuck in the mud" trying to convert some frequency space(broadcast
TV channels 60-69), in order to "auction it off" to the highest bidders
to support the very services you and I speak of. But this could take
YEARS! And so we fall farther and farther behind the world in
technology! It is actually possible to do many of the mobile PDA
applications, using existing inexpensive ham technology, on ham freqs
right now - don't believe what you hear from the old "PBBS tight-
sphinctered naysayers".

Thanks for the info - I'll check it out next week. I work on my remote Rosarito homesite on the weekends, and I only have a 1200bps packet link set up down there so far. Eventually, I'll be able to go thru an Internet Gateway at my place in San Diego.

Um Stew ... you just directly responded to Charles.

Ya gonna get that startup going, ya better spend less time here, and
more time putting together the business plan. Of course it has already
been done, in Japan and in Europe, and there are three companies
about to roll it out here in the US, but that shouldn't stop you.

It's even worse than that. There are several companies about to roll
out some interesting messaging services in the US. Have looked at
three of them in some detail, prior to investing. No need to wait for new
freqs to open up, plenty of ways to do it via mods to existing services.

4239. To Break The First Commandment...Trinity 9018

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-10-07 04:15:52 UTC
From: unityNO-SPAM@cfl.rr.com
Message-ID: <YrxD5.48222$1H2.3528793@typhoon.tampabay.rr.com>
Source record: 10614

Mark 12:29 And Jesus Answered Him, The First Of All The Commandments Is, Hear, O Israel; The Lord OUR God Is One Lord:

This is the first commandment that Jesus gave and that is "The Lord OUR God Is One Lord". If Jesus only said: "The Lord YOUR God Is One Lord" ,there would have been some ambiguity as to whether Jesus was God. But Jesus said ♦The Lord OUR God Is One Lord♦ therefore he removed all ambiguity by his utterance so that no one can ever rightly say that Jesus was God. Someone who has a God can never be your God. This is the first commandment of Jesus yet we see that the majority of Christiandom break this very first commandment by making Jesus their God and then they think they are saved and will inherit paradise. Such a belief is totally unbiblical and against the teachings of Jesus.

Jesus said:

Mt 19:17 And He Said Unto Him, Why Callest Thou Me Good? There Is None Good But One, That Is, God: But If Thou Wilt Enter Into Life, Keep The Commandments.

Jesus didn't say "take me as your personal savior and you will go to heaven" he said "Keep The Commandments", yet most Christians break the very first commandment of Jesus in the Bible let alone other commandments, by taking Jesus as a God and then they expect to go to heaven! It is one of the strangest religious phenomenon in existence.

Jesus said:

Mt 5:20 For I say unto you, That except your righteousness shall exceed the righteousness of the scribes and Pharisees, ye shall in no case enter into the kingdom of heaven.

Righteousness is not defined by faith alone but through faith and deeds, and Jesus is saying that heaven is not for you if your righteousness is not better than the practicing jew. Now we shall look at other biblical verses that make the picture more clear, though the above is quite sufficient for those that are truthful to themselves:

Num 23:19 God Is Not A Man, That He Should Lie; Neither The Son Of Man, That He Should Repent: Hath He Said, And Shall He Not Do It? Or Hath He Spoken, And Shall He Not Make It Good?

This verse is in the Old Testament and it is quite explicit and clear. No man can be God. Not only that but no son of man can be God. The New Testament did not come to contradict the Old Testament; it came to fulfill it so it is obvious that Jesus was not God.

John 9:11 He Answered And Said, A MAN That Is Called Jesus Made Clay, And Anointed Mine Eyes, And Said Unto Me, Go To The Pool Of Siloam, And Wash: And I Went And Washed, And I Received Sight.

Mt 8:20 And Jesus Saith Unto Him, The Foxes Have Holes, And The Birds Of The Air Have Nests; But The SON OF MAN Hath Not Where To Lay His Head.

Jesus is called both a man and the son of man in the New Testament so many times.

Job 25:4-6 How Then Can Man Be Justified With God? Or How Can He Be Clean That Is Born Of A Woman? Behold Even To The Moon, And It Shineth Not; Yea, The Stars Are Not Pure In His Sight. How Much Less Man, That Is A Worm? And The Son Of Man, Which Is A Worm?

This verse shows that man can not even be rightly compared to God (let alone be God). Nothing is pure or clean compared to God. We are all like worms compared to God. Even the son of man is like a worm compared to God (there is no comparison). It is very interesting that the verse states that "How Can He Be Clean That Is Born Of A Woman". Jesus was born of a women, though Mary was the holiest of women but she was still a woman. So in the biblical terminology even Jesus is not pure compared to God so how in heaven or earth can anyone call him God? This reminds me of the well recorded statement of Jesus recorded in the New Testament so many times:

Luke 18:19 And Jesus Said Unto Him, Why Callest Thou Me Good? None Is Good, Save One, That Is, God.

Mark 10:18 And Jesus Said Unto Him, Why Callest Thou Me Good? There Is None Good But One, That Is, God.

Mt 19:17 And He Said Unto Him, Why Callest Thou Me Good? There Is None Good But One, That Is, God: But If Thou Wilt Enter Into Life, Keep The Commandments.

Jesus is repeatedly saying, "I am not good, only God is good, I am not pure, only God is Absolutely Pure and Holy and glorious is His name. If you want to go to heaven KEEP THE COMMANDMENTS. " But what do we say? We say "If you want to go to heaven call Jesus GOD and believe he died for you!" It is so unbiblical let alone against common sense.

Jesus says:

John 20:17 Jesus Saith Unto Her, Touch Me Not; For I Am Not Yet Ascended To My Father: But Go To My Brethren, And Say Unto Them, I Ascend Unto My Father, And Your Father; And To My God, And Your God.

Jesus is calling God both my God and your God, my Father and your Father. If Jesus has a God Jesus can't be God. It is simple common sense. If Jesus was God who did Jesus pray to, himself? Imagine Jesus (if he was God) falling on his face praying to himself? God does not pray, but his servants pray to Him.

John 11:42 And I Knew That Thou Hearest Me Always: But Because Of The People Which Stand By I Said It, That They May Believe That Thou Hast Sent Me.

Mt 26:39 And He Went A Little Farther, And Fell On His Face, And Prayed, Saying, O My Father, If It Be Possible, Let This Cup Pass From Me: Nevertheless Not As I Will, But As Thou Wilt.

Heb 5:7 Who In The Days Of His Flesh, When He Had Offered Up Prayers And Supplications With Strong Crying And Tears Unto Him That Was Able To Save Him From Death, And Was Heard In That He Feared;

Mt 27:46 And about the ninth hour Jesus cried with a loud voice, saying, Eli, Eli, lama sabachthani? that is to say, My God, my God, why hast thou forsaken me?

Mark 15:34 And at the ninth hour Jesus cried with a loud voice, saying, Eloi, Eloi, lama sabachthani? which is, being interpreted, My God, my God, why hast thou forsaken me?

Luke 5:16 And he withdrew himself into the wilderness, and prayed.

Luke 22:44 And being in an agony he prayed more earnestly: and his sweat was as it were great drops of blood falling down to the ground.

Mt 26:36 Then cometh Jesus with them unto a place called Gethsemane, and saith unto the disciples, Sit ye here, while I go and pray yonder.

Mt 4:10 Then saith Jesus unto him, Get thee hence, Satan: for it is written, Thou shalt worship the Lord thy God, and him only shalt thou serve.

Lu 4:8 And Jesus answered and said unto him, Get thee behind me, Satan: for it is written, Thou shalt worship the Lord thy God, and him only shalt thou serve.

We all know that only God is omnipotent. God can do anything He wills. He has full power over all of His creation. If somone admits that he/she is not omnipotent it is obvious as the sun that that person can never be God. So what did Jesus say about this?

John 5:30 I Can OF MINE Own Self DO NOTHING: As I Hear, I Judge: And My Judgment Is Just; Because I Seek Not Mine Own Will, But The Will Of The Father Which Hath Sent Me.

John 12:49 For I have not spoken of myself; but the Father which sent me, he gave me a commandment, what I should say, and what I should speak.

John 7:16 Jesus Answered Them, And Said, My Doctrine Is Not Mine, But His That Sent Me.

John 8:42 Jesus Said Unto Them, If God Were Your Father, Ye Would Love Me: For I Proceeded Forth And Came From God; NEITHER CAME I OF MYSELF, But He Sent Me.

John 17:3 And This Is Life Eternal, That They Might Know Thee The Only True God, And Jesus Christ, Whom Thou Hast Sent.

John 6:29 Jesus Answered And Said Unto Them, This Is The Work Of God, That Ye Believe On Him Whom HE Hath Sent.

Let alone claiming to be omnipotent, not only does Jesus admit that he is not but he says that he is capable of doing absolutely nothing on his own. That is how humble he is before his Creator. He furthermore admits that there is a difference between his will and the will of God but that which makes him special is that he seeks the will of God and not his own will. He furthermore clarifies that God sent him. If Jesus was God he wouldn't say God sent him, he would say I came on my own power and leave. Imagine someone saying "I sent myself"! It doesn't make any sense at all to say that Jesus is God.

Joh 13:16 Verily, verily, I say unto you, The servant is not greater than his lord; neither he that is sent greater than he that sent him.

Joh 14:28 Ye have heard how I said unto you, I go away, and come again unto you. If ye loved me, ye would rejoice, because I said, I go unto the Father: for my Father is greater than I.

We all know that only God knows everything. God is omniscient. If someone admits that they don't know everything that person can never be God. It is very obvious. So what did Jesus say about knowing everything?

Mr 13:32 But of that day and that hour knoweth no man, no, not the angels which are in heaven, neither the Son, but the Father.

Mt 24:36 But of that day and hour knoweth no man, no, not the angels of heaven, but my Father only.

Jesus admits that he does not have knowledge of the hour (the day of Judgement). Only God knows that. Therefore it is clear that Jesus is not God. A lot of poor christians take the words of Jesus out of context and interpret it the way they want to believe but Jesus himself makes the meanings of his words quite clear for those that want to listen. Some take the words of Jesus "I and my father are one" to mean that Jesus is God. Such poor christians are unfair only to themselves. Jesus explains the meaning of biblical oneness:

John 17:21 That They All May Be One; As Thou, Father, Art In Me, And I In Thee, That They Also May Be One In Us: That The World May Believe That Thou Hast Sent Me.

So looking at the above verse do you ever hear anyone saying that all of us are also God because Jesus is one with the Father and we are all one with the Father and Jesus? Of course not, so why deliberately misinterpret the words of Jesus? The &#65533;oneness&#65533; that Jesus talks about is oneness in purpose.

Lastly I will quote something that alone makes the truth clear for those that want to see:

1Jo 4:12 No man hath seen God at any time. If we love one another, God dwelleth in us, and his love is perfected in us.

1Ti 1:17 Now unto the King eternal, immortal, invisible, the only wise God, be honour and glory for ever and ever. Amen.

1Ti 6:16 Who only hath immortality, dwelling in the light which no man can approach unto; whom no man hath seen, nor can see: to whom be honour and power everlasting. Amen.

No man can see God. Jesus was seen therefore Jesus is not God. It is simple as 1+1=2 but for those that have been indoctrinated (brain-washed) since childhood that 1+1+1=1, no wonder so many people can't see straight!

peace,

4240. Help: Connecting TH-D7 to TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-10-07 04:19:07 UTC
From: communder@my-deja.com
Message-ID: <8rm87n$fp8$1@nnrp1.deja.com>

The inbuilt TNC of the TH-D7 is awful for data transmission with PC! Is it possible to connect the Kenwood TH-D7 transceiver to an external 9k6 bps TNC? Parts need to be replaced on the PCB or only "wiring"?

Please give me some clues!

Good question. Do some companies sell cables for connecting
Morse keys to rigs as well? It sounds like some people would need it.

(Or do some keys come with cables too? My Hi-Mound didn't,
and my FT-847 has an odd key connector anyway.)

It's not very common, but try around 14063 kHz or so.
The new mode MFSK16 (http://www.qsl.net/zl1bpu/ for information)
is a bit easier to use and is similar in principle (ie multiple
frequency shift keying).

Regards
Hamish

Hi TNX for reading,

I recently bought a TNC MFJ 1278B together with the original software (mfj 1289).

Does anyone know if I can also use other software on this modem?
And if so where to find it ??

Tnx de PA3DWC, Gerrit

No I didn't buy/order the 2m/70cm transceiver yet.
Maybe you know other handy-transceivers (2m/70cm) suitable for my needs.

Should do/have:

- 2m/70cm TX(at least @2m) and RX both - high power transmission output (at least 5 W) - good sensivity - no TNC as TH-D7, but at least modifiable(better a socket) for connecting a 9k6 modem/TNC. - a mobile with <3A ("draw"?) at 5watts output would suit too but is maybe not available.

I have carefully. The entire point is that for example, one can now order a pizza using an autopatch if one has no financial interest in the pizza business. Once behavior like that was banned, but now it isn't. It's also a joke as I have yet to hear a pizza or similar item ordered over an autopatch. Similarly, we could have this discussion on packet radio despite having internet access as far as I can tell. Of course the reliability of messages getting through would be less. If you're correct, then packet radio for the most part shouldn't exist at all except for things like APRS. Reading your interpretation literally, most of amateur radio shouldn't exist.

I understand the difference between commercial interest and no commercial interest.
Looking at 97.111, 97.113, 97.115, 97.117, and 97.121, I don't see what you're claiming. Which section are you claiming should be applicable? I understand also the prohibition on REGULAR transmissions if there is another available service, but you imply a total ban, which doesn't exist.

Read about automatic control and third party messages.
The topic was handling internet email via ham radio.

I implied no such thing.

The topic was the regular handling of internet email via ham radio, to
avoid the use of a common carrier internet connection.

MJF has 1289W for Windows @
http://www.mfjenterprises.com/software/mfj1289.html
Not sure if it's been updated since 1993.

Yes, you can use other software, authors usually indicate what TNCs will work.

Probably because a lot of the problems are flaky software and flaky device drivers; the wiring part is trivial.

I have a dual boot machine that runs Linux and Windows 98. It is interfaced to the radio.

Under Linux I run twpsk, and except for an occasional core dump, runs pretty well.

Under 98, I have (so far) tried WinPSKse and DigiPan.

WinPSKse runs fine immediatly after an install. If you quit the program then re-run it, all sorts of flaky things happen; sometimes it won't receive, sometimes it won't transmit. If you delete all the registry entries for it, it will run fine until you exit the program again.

I have never gotten DigiPan to receive anything or show any sign that it is listening or talking to the sound card.

Keep in mind this is the same hardware in all cases.

Jim Pennino

Not to mention that most who write Microsoft Windows apps don't relese
the source code. This means that if they don't test under every Windows
software/hardware you're screwed if it doesn't work.
Linux devlopers on the other hand normally release as Open Source or
under the GNU license. This way if it doesn't work, the reason can be
found by the user, if they are so inclined, corrected and the correction
submited to the orginal author for inclusion in a future release. This
is what made Linux the great stable OS it is today. Not hiding
everthing, but leaving it open so if a bug is found, the finder might be
able to fix it. Or, even better another might make changes for his own
preferences, or add enhancements.
